I. EXECUTIVE SUMMARY

Scope

The improvement of water quality in the streams and groundwaters of the New River Valley via the development of public wastewater collection, treatment and disposal infrastructure is one of the most challenging issues facing local governments within the New River Valley Planning District (NRVPD). Many miles of rivers and streams in the NRVPD have water quality violations due to bacteriological impairments (fecal coliform and *Escherichia coli*). The collection, treatment, and disposal of wastewater are one way to address a portion of the human cause of these bacteriological impairments.

Localities in the New River Valley face water quality issues in areas within their jurisdiction because many areas have clusters of housing that currently have no acceptable means of wastewater treatment. In fact, many households are currently discharging into inadequate septic systems, affecting environmental quality as well as public health.

The presence of approved wastewater collection and treatment systems is essential for the enhancement of public health, protection of the environment, successful economic development initiatives, and an increase in new housing production. Some of the most common problems resulting from the lack of this vital infrastructure include, but are not limited to, the following:

- Numerous environmental and public health problems arising from the use of failed, overstressed, and/or poorly maintained on-site septic tank/drain field systems;
- An inability to accommodate new housing production due to shallow depths of soil to bedrock and/or high groundwater conditions on potential building lots thereby preventing the approval of septic tank/drainfield systems;
- The lack of public wastewater collection and treatment systems limits the ability of planners and local officials to market portions of the NRVPD to potential industrial prospects. Economic development activities are underway throughout the New River Valley in an effort to attract new industries, create jobs, and diversify the local economy. In many cases, the ability to market the region to a particular industrial prospect is directly linked to the availability of public wastewater collection and treatment services. Potential industries expect public wastewater collection and treatment to be available. Moreover, the prospect of developing mass septic tank/drainfield systems to accommodate industrial users is problematic due to costs and the resulting land area requirements.

Purpose

With generous funding provided by the Southern Rivers Watershed Enhancement Program, the New River Valley Regional Wastewater Study is intended to address water quality improvement through the development of sewage collection and treatment alternatives. The Study's goals include identifying the

need for sewer service in the region, identifying and prioritizing projects, finding and identifying funding sources for these projects, and eliminating the health hazards and environmental problems associated with inadequate septic systems and straight pipe discharges to streams. The study also identifies projects that due to their remote location, topographic situations, small size or soil conditions, will benefit from non-traditional decentralized wastewater systems (DWS). It is envisioned that the Study will serve as a road map for future implementation of sanitary sewer collection, treatment and disposal projects in the New River Valley.

Methods

During the course of this Study, the Design Team examined over 134 projects. These projects were analyzed and prioritized based on the degree of health hazard, elimination of water quality problems, the number of customers served, construction cost per connection, facility availability, as well as residential and industrial growth potential.

Conclusions

The project rankings led to a recommendation to pursue 20 centralized projects and 6 de-centralized projects.

The 20 centralized projects will serve more than 3,135 connections at a cost of \$67,404,744. The 6 de-centralized projects will serve 424 connections at a cost of \$5,562,970.

Recommendations

There is very little grant funding available for sanitary sewer projects, despite the urgent need that has been identified in this Study. It is imperative that additional grant funding be established to help solve this critical environmental and public health threat, such that the New River Valley can benefit from a cleaner, healthier and more economically viable future. DHCD and the Governor should recognize this study as an example of the water quality issues and solutions in the Southern Rivers region of the state and recommend that the General Assembly fund the Southern Rivers Program to provide matching and leverage funding to undertake the primary priority projects.

Table 1 - Cost Summary Centralized Systems (Primary Priority)

II. INTRODUCTION

Purpose

In 2007 the Virginia General Assembly allocated funds to improve water quality in the streams and groundwaters of the “Southern Rivers” region of Virginia. The Department of Housing and Community Development was allocated \$17,000,000 for the Southern Rivers Watershed Enhancement Program (SRWEP) to improve water quality in non-Chesapeake Bay watersheds. Generally, this program was designed to target the construction, expansion or enhancement of publicly-owned wastewater treatment systems to provide measurable community development benefits.

Three program priorities were identified: 1) to improve water quality and enhance community development by eliminating the direct discharge of untreated household wastewater into streams or groundwater, 2) to improve water quality and enhance community development by eliminating deficient household wastewater systems that threaten to pollute streams or groundwater, and 3) the construction, expansion or enhancement of publicly-owned and managed wastewater treatment systems that enhance community development and provide significant, documentable improvements in stream and groundwater water quality.

Cities and counties in the watersheds of Virginia that do not drain into the Chesapeake Bay were eligible for funding through the SRWEP. Three grant programs were developed for eligible localities: planning grants, managed on-site construction grants, and wastewater treatment system construction grants.

To address some of the issues of water quality in the New River Valley region, focusing on improving wastewater collection and treatment, the New River Valley Planning District Commission applied for a SRWEP planning grant in early 2008. The localities included in this application are: Floyd, Giles, Montgomery, and Pulaski counties, and the Towns of Floyd, Pembroke, Pearisburg, Narrows, Rich Creek, Glen Lyn, Blacksburg, Christiansburg, Dublin, and Pulaski. Figure I depicts a location map for the region.

The study resulting from the SRWEP planning grant is the New River Valley Regional Wastewater Study (NRVRWS). The intent of this NRVRWS is to address water quality improvement through the development of sewage collection and treatment alternatives, including traditional centralized systems and de-centralized wastewater systems (DWS). The study identifies specific projects, prioritize them and provides project costs. This study serves as a road map for sewer projects in the New River Valley over the next twenty years.

This study included the cooperative development of an overall project list to be evaluated. The development of the project list was facilitated by the Advisory Management Team (AMT), consisting of members representing the PDC, the local health districts, funding agencies, local watershed groups, sewer providers, local government representatives, concerned citizens and the Design Team. The AMT met monthly throughout the project to advise the Design Team on various aspects of the project including project selection/evaluation, study contents, criteria for the ranking matrix and the timetable of activities.

Scope

Thompson & Litton, in association with Maxim Engineering was commissioned to prepare this study with emphasis on projects that illustrate the urgent need for sewer facilities in the region, such that funding can be secured for projects that will have a maximum positive impact on the health and environmental quality within the New River Valley Planning District. As a planning document, the study only evaluates each project in sufficient detail to assemble cost estimates. The design team made use of the available planning documents for each county as well as River Basin Studies, preliminary engineering reports and comprehensive master plans.

Uniform cost estimating methodology was developed to prepare estimates for the projects studied herein. Recognizing that construction costs may vary to some degree within the study area, uniform unit pricing has been used to justify cost estimates. Unit pricing was developed by averaging recent bid data from the study region.

Figure I - Location Map

III. WASTEWATER PRIMER

Water leaving a home (“wastewater”) has much different characteristics than water entering a home (“potable water”). This section explains, in simple terms, the definition of wastewater and its various components.

Wastewater contains the following components...microorganisms, toxic substances, solids, organic material, and nutrients...each of which must be addressed by a treatment system prior to discharge into the environment. Each component can be more fully described as follows:

Microorganisms

Microorganisms in wastewater include bacteria, viruses and protozoans. Some of these microorganisms are helpful in breaking down the contaminants in wastewater, while others can cause disease. Disease causing microorganisms are called pathogens.

People who come in contact with contaminated drinking or recreation water risk infection and development of diseases such as cholera, typhoid, dysentery and hepatitis.

The main sources of waterborne pathogens include leaking collection systems, failed septic systems, failed treatment, feedlot runoff, and fecal wastes of wildlife in a natural setting.

As it is not practical to test wastewater for each type of pathogen, the degree of contamination of water by human and animal wastes is gauged by the level of fecal coliform bacteria present.

Toxic Substances

Toxic substances found in wastewater can include pesticides, herbicides, paints, solvents and heavy metals. These substances are often disposed of unknowingly by homeowners who flush them into the wastewater collection system.

Many of these common toxic substances are known to cause cancer or other human health problems.

Solids

Wastewater typically contains solid materials including sand particles, grit, clay, wood, fecal waste and food. These solids can accumulate in waterways, causing fouling and damage to higher order organisms.

The presence of solids is measured as Total Suspended Solids (TSS)...these are solids that will not readily settle out.

Organic Material

Organic materials are derived from plants and animals, and come mainly from feces and kitchen wastes. This material is a source of food for the bacteria in wastewater. As organic material is broken down

(decomposes), oxygen in the water is consumed, making less available for aquatic life. This can result in fish kills or otherwise impair aquatic life.

Concentrations of organic matter are measured as Biochemical Oxygen Demand (BOD).

Nutrients

Nutrients in wastewater include nitrogen and phosphorous, both of which can have a negative impact on receiving waters.

Phosphorous is the limiting nutrient in aquatic ecosystems. The addition of phosphorous results in excessive algae and plant growth. As these plants die, they deplete dissolved oxygen and harm the aquatic community.

Nitrogen comes from domestic, industrial and agricultural sources and undergoes a cyclic process where various forms of nitrogen, including ammonia, are produced. Ammonia is extremely toxic to aquatic organisms. Nitrate, another form of nitrogen can cause methemoglobinemia (when found in drinking water sources), a serious health effect in infants and pregnant or lactating women.

IV. WATER QUALITY AND GEOLOGY

The New River Basin covers over 3,000 square miles in Virginia, almost 8% of the Commonwealth’s total land area. The New River traverses approximately 87 miles in Virginia, running through three of the four counties in the Planning District on its way to West Virginia. Almost 400 miles of the New River and its tributaries in Virginia are considered impaired due to high levels of fecal coliform or E. coli, possibly due to failing or deficient wastewater systems. More than 1,400 square miles of the New River watershed make up the New River Valley Planning District and are the focus of this study.

Impairment listing of surface waters in the New River Valley result from a violation of one of several possible criteria, including but not limited to benthic macroinvertebrates, bacterial, temperature, or dissolved oxygen levels. The impaired classification of a body of water is determined by monitoring station testing as indicated by the Clean Water Act. Once a waterbody has been classified as impaired, a Total Maximum Daily Load (TMDL) Development is required. TMDL Developments establish a maximum pollutant load capacity and/or a benthic health standard of an impaired body of water, establish the probable stressor, or stressors, causing the impairment, and determine plausible implementation plan(s) that will result in the meeting of existing water quality standards. The document, *Guidance for Water Quality-Based Decisions: The TMDL Process* (United States Environmental Protection Agency, 1999), states:

According to Section 303(d) of the Clean Water Act and EPA water quality planning and management regulations, States are required to identify waters that do not meet or are not expected to meet water quality standards even after technology-based or other required controls are in place. The waterbodies are considered water quality-limited and require TMDLs.

...A TMDL is a tool for implementing State water quality standards, and is based on the relationship between pollution sources and in-stream water quality conditions. The TMDL establishes the

allowable loadings or other quantifiable parameters for a waterbody and thereby provides the basis for States to establish water quality-based controls. These controls should provide the pollution reduction necessary for a waterbody to meet water quality standards.

TMDL Developments have been prepared for a portion of Back Creek in Pulaski County, Crab Creek in Montgomery County, the Dan River and its tributaries in Floyd County, Dodd Creek in Floyd County, Mill Creek in Montgomery County, Peak Creek in Pulaski County, Stroubles Creek in Montgomery County, and Wilson Creek in Montgomery and Floyd Counties. Of the above listed TMDL Developments, all but TMDL for Stroubles Creek was in response to a bacteriological impairment due to multiple monitoring station violations of the fecal coliform standard.

TMDL Developments are followed by TMDL Implementation Plans (IPs) which establish a staged implementation strategy that will result in the attainment of existing water quality standards. An IP identifies specific measures that must be taken to reduce pollution levels in the identified waterbody and a schedule of events to attain this required reduction in a staged manner. The schedule includes an impact and cost analysis of each step as well as monitoring to determine successful implementation of each step. Also included are suggestions to establish user education and desired involvement in the IP.

TMDL IPs have been established for Back Creek, Dodd Creek, Mill Creek and Stroubles Creek. Back, Dodd, and Mill Creeks' IPs include required bacteriological reductions in response to the violations of the fecal coliform standard. TMDL Reports, Implementation Plans and Implementation progress updates are available on DEQ's TMDL website at <http://www.deq.virginia.gov/tmdl>. A map illustrating the impaired streams in the New River Valley is presented in Figure 2. Table 3 provides a listing of these streams.

As many of the region's residents identify water quality as a top priority, there is a need in the New River Valley Planning District to examine the quality of water in the region's surface water, including streams, rivers, lakes, and ponds. The New River, along with Claytor Lake, supplies a large percentage of the water to residents of the region, including Pulaski County PSA, the Blacksburg/Christiansburg/VPI Water Authority and the City of Radford. Additionally, Montgomery County purchases some of the water it distributes to its residents from New River sources.

The planning district consists of Floyd, Giles, Montgomery and Pulaski Counties. Floyd County is located in the Blue Ridge Province, which is a relatively narrow zone of high mountains. The rocks underlying the area are granite, gneiss, and marble. Steep terrain and a thin soil covering result in rapid surface runoff and low ground water recharge. Water quality is generally good, and the pollution potential of ground water is low in this province. However, it should be noted, many residents in some of the more sparsely populated areas of Floyd, Giles, Pulaski and Montgomery counties still utilize springs as drinking water sources, which are highly susceptible to surface water influence and contamination.

Table 3 (Contd.) – List of Impaired Streams in New River Valley

Giles, Montgomery and Pulaski Counties are located in the Valley and Ridge Province. The ridges and upland areas of these counties are generally covered by forests and are often underlain by sandstone and shale. The ground water moves slowly through these soils, and the pollution potential of ground water and surface water is low. It is a different story in the valleys, which are used for agricultural and residential lands. The valleys are underlain by shales and carbonate rocks, such as limestone and dolomite. These rocks are relatively soft and easily dissolved, and thus form karst. Characteristic features of karst include caves, sinking streams that disappear into holes in the bedrock, and sinkholes formed by the collapse of subsurface voids. The Department of Conservation and Recreation reports that karst underlies 50% or more of the New River watershed and an even larger proportion of the valley floors where population and development are concentrated. Ground water flows quickly through karst topography, and therefore receives very little filtration. Also, surface water and ground water sometimes intermingle, and this makes for an environment that is easily contaminated. This intermingling may explain why Walker Creek, which originates in Bland County and flows a long distance through sparsely populated areas of Giles County, is bacterially impaired throughout its entire length.

The College of Environmental Engineering at Virginia Tech estimates that one-half of all septic systems in Virginia are not functioning correctly. Surface water contamination can occur when the soil becomes clogged with waste particles causing the untreated wastewater in the drain field to make its way to the surface and eventually be washed into the stream during precipitation events. A more significant failure is when these pollutants move too quickly through the soil and pollute the groundwater. This type of failure occurs in soils with high permeability or in karst topography.

There are other factors which contribute to contamination: 1). The design life of septic systems averages thirty years. There are many systems in the New River watershed installed before 1980, which have exceeded their design life and may no longer be operating properly. 2). The density of septic systems in an area may also contribute to contamination. The Environmental Protection Agency has determined that as few as 40 systems per square mile (one system per 16 acres) can cause ground water contamination.

V. HEALTH RISK

By using water, impurities are added that pollute it. Common pollutants include human wastes, nutrients and household chemicals. Polluted water results in public health problems and damages aquatic ecosystems.

It is estimated that, in the United States, 10% of on-site septic systems have stopped working and that some communities report failure rates as high as 70%. In Virginia, one of the leading causes of impairment in our rivers and streams is violation of bacteria standards. Failing septic tanks are reported as a significant contributing source for these water quality problems. The federal Centers For Disease Control and Prevention estimates that 73,000 Americans are infected and 61 die each year from a virulent form of coliform bacteria.

The effects of this pollution can be far reaching, resulting in the degradation of our natural resources, increased costs for treating drinking water, illness and even death.

Disease causing organisms, also called pathogens, make water unsafe for drinking, recreation and most other uses. People who come in contact with contaminated water, whether by drinking or recreation, risk infection and development of diseases such as cholera, typhoid, dysentery, viral hepatitis A, salmonellosis, shigellosis, sporadic viral gastroenteritis, epidemic viral gastroenteritis, and amebiasis. Sources of waterborne pathogens (bacteria, viruses and parasites) include failed septic systems, straight pipes, leaking collection systems, failed treatment and feedlot runoff. These diseases may also be contracted through contact with any number of creatures that have been exposed to untreated waste, including dogs, cats, rats, flies, cockroaches, fleas and a host of others.

Other health risks from coming in contact with contaminated water include:

- Contact with toxins (pesticides, herbicides, paints, solvents, heavy metals...) Many of these substances are known to cause cancer and other serious human health problems.

- Contact with nitrate (from nitrogen) in water. High nitrate levels in groundwater can result from inadequately treated wastewater and can cause methemoglobinemia, a serious health problem for infants and pregnant or lactating women.
- Contact with synthetic cleaning products or other chemicals used around the house can be toxic to humans, pets and wildlife. These products can reach the ground surface or end up in the water.
- Flies and mosquitoes that are attracted to and breed in wet areas where wastewater reaches the surface can also spread disease.

Inadequate treatment of wastewater can also allow excess nutrients to reach streams, lakes and ponds, promoting algae or weed growth. Algal blooms and abundant weeds not only make the water body unpleasant for recreation (swimming, boating), but they also affect the water quality for fish and wildlife habitat. As plants die, settle to the bottom, and decompose, they use up oxygen that fish need to survive.

VI. WASTEWATER SYSTEMS

There are three basic types of wastewater systems available - conventional onsite systems, central systems, and decentralized systems. Each type is explained below.

CONVENTIONAL ONSITE SYSTEMS

The individual onsite septic system, consisting of a septic tank and drain field, has been the primary treatment and disposal system of domestic wastewater in rural areas in the New River Valley for many years. These systems, when properly situated, designed and maintained work well, but have an average life of thirty (30) years due to the soils becoming clogged with particle created in the purification process. When the soil becomes clogged, the inadequately-treated wastewater in the drain field comes to the surface and may be washed into the stream during precipitation events. This type of system failure is easily detected, and can be corrected although often at a high cost to the homeowner. The second type of failure is caused when the wastewater is washed through the soils so quickly that the bacteria is not killed. This failure type can occur either where the soil is highly permeable or where subsurface fracturing exists (karst topography). This type failure occurs underground and is difficult to detect. Ground water contamination can result if this type of septic system failure goes undetected, especially in concentrated communities. Ground water contamination is very expensive to clean up: therefore, prevention is essential to protecting this valuable natural resource. Regulating conventional onsite systems has been the responsibility of the Virginia Department of Health (VDH) for many years.

CENTRALIZED WASTEWATER SYSTEMS

Centralized wastewater systems are the most common type of publicly owned wastewater systems and contain collection lines and a centralized treatment facility. They are used to collect and treat large volumes of wastewater. The collection system typically requires large diameter pipes, deep excavation, and frequent manhole access. At the treatment facility, the wastewater is treated to standards required for discharge to a surface water body. The large amounts of bio-solids (sludge) generated are either land-applied, placed on a surface disposal site or incinerated.

DECENTRALIZED WASTEWATER SYSTEMS

Decentralized wastewater systems are collection, treatment and disposal systems designed to serve small communities that cannot be economically served by a centralized system. These systems are fairly new and provide permanent infrastructure when adequately managed. In order to protect their investments, developers and funding agencies usually require that these systems be owned and operated by a public utility.

Collection Systems

In most cases, sewage flows through the building sewer to an interceptor (septic) tank. The interceptor tank is the first and a very key component in decentralized wastewater systems. The interceptor tank is a watertight vessel that provides a quiet environment where the solids can settle. The solids, called septage, are subsequently disposed of at a central treatment facility or stabilized and land applied at an approved site. Tanks are equipped with risers to the surface for easy access and inspection, and generally require pumping about once every ten years.

The filtered effluent from the interceptor tank is conveyed to the treatment system through a common collection line. Thus, these collection lines are called effluent sewers. Effluent sewers have several cost advantages over centralized wastewater systems: (1) they are smaller in diameter, (2) they do not need to be installed as deep or on grade, and (3) they do not require manholes for access. There are two types of effluent sewers, gravity and pressure. Gravity systems are known as STEG, meaning septic tank effluent gravity, and pressure systems are known as STEP, for septic tank effluent pumping. Following collection, there are a number of treatment and disposal system alternatives that can be used to treat wastewater.

Treatment Systems

Alternative treatment systems include small aerobic treatment plants and bio-filtration systems using a variety of materials, such as sand, peat, synthetic textile, or open cell foam, as the filter medium.

Disposal Systems

When the treated effluent is dispersed into the soil for further treatment, it is called an "onsite" system, and is governed by the Virginia Department of Health (VDH). Permitting and sampling requirements for onsite systems are minimal, so it is a low-cost method of disposal. Dispersing treated effluent into the soil helps recharge the water table. Also, because the area serviced by a decentralized system is relatively small, the recharge applies to the area where the water was used. This is particularly important during times of drought.

There are several soil dispersal methods available including conventional gravel trenches, non-gravel trenches utilizing infiltration chambers or synthetic aggregate, low-pressure distribution, drip dispersal, and spray irrigation. The soil texture and depth to a restriction determine which dispersal method will work best for a project site. Designing an onsite system requires a detailed soil and site evaluation to be made at each site. This evaluation is often conducted jointly by a soil scientist and an engineer.

Conducting the soil and site evaluation was not done for the projects listed in this study, since the scope of the study was only to identify where there was an urgent need for sewer facilities.

There is a current trend toward water conservation and re-use. Because of their small size, there are many possibilities for reusing the treated effluent from decentralized wastewater systems. These re-uses include plant irrigation in greenhouses, nurseries, or parks; irrigation of fairways and greens at golf courses; steam generating facilities; or other uses, such as car washes. The cost of preparing the effluent for re-use would be offset by a reduction in the need for clean, drinking water. Reuse systems are regulated by the Virginia Department of Environmental Quality (DEQ).

Finally, there are project areas where neither onsite dispersal nor reuse options exist. In such instances, a permit can be obtained from DEQ to allow the treated effluent to be discharged to surface waters, or to a dry ditch. The treated effluent must be disinfected before discharging it. Disinfection methods include chlorination and de-chlorination, ultraviolet (UV) light, and ozone. Permitting and sampling costs are always higher for discharging systems; but, more importantly, there is a concern right now that more stringent permit requirements for total nitrogen (TN) and total phosphorus (TP) will soon be placed at all wastewater treatment plants. Should this occur, even though the decentralized plants are small, the operating costs would increase significantly.

System Size

Decentralized systems can be designed for any size community. In this wastewater study, a cluster of fifteen homes was the minimum size community to be considered for a decentralized wastewater system.

Benefits

The primary benefit of decentralized wastewater systems is an improvement to the public health and environment in any area where they are used. These systems are not in competition with the central wastewater facilities, but can be used by a governing body (town or county) to complement "big pipe" systems. Decentralized systems can be installed in any community where conventional onsite systems are not an option. These systems can also be installed quickly in environmentally sensitive areas, without having to wait for several miles of a centralized system to be constructed, which may consist of several projects, before central sewer service is available to that community.

When decentralized systems are owned by a responsible management entity (RME), it becomes part of our nation's permanent infrastructure. The U.S. Environmental Protection Agency (EPA) requires that all new systems be owned and maintained by a public body, or other responsible management entity that annually demonstrates that it is fiscally responsible for maintaining the system. All decentralized systems must generate sufficient income to cover operation and maintenance costs. Proper maintenance guarantees that the homeowner receives the same full service as with central sewers. The only noticeable difference is that since the interceptor tank is generally located on the homeowner's property, a utility employee will periodically visit the tank to clean the effluent filter and measure the sludge and scum (floating material) buildup in the tank.

Beyond these primary benefits, however, there are secondary benefits of managed DWS, discussed as follows.

Benefits to public utilities:

1. DWS allow utilities to add sewer service to their other services, expanding both their customer base and their revenue base.
2. DWS are economical to install. An entire decentralized system (including collection, treatment, and disposal) often cost less than extending a conventional gravity sewer line, especially in less populated areas. DWS also conserve the capacity of the central treatment facility, thus avoiding the expense of a plant expansion.
3. DWS are economical to operate and maintain. They require routine maintenance every few months and their performance can be monitored and controlled using remote telemetry. Two or three employees can maintain DWS serving hundreds of homes.
4. DWS often allow utilities to acquire land for treatment facilities at minimum expense, as developers may deed over land for treatment in exchange for the benefits of a managed DWS.

Benefits to Homeowners:

1. Home sites become available in areas where central sewers do not exist and/or conventional septic systems do not work.
2. Homeowners are relieved of maintaining an onsite sewer system.
3. Monthly sewer rates are typically lower than with centralized systems because the costs of installing and maintaining the DWS are lower.

Benefits to Developers:

1. A prime residential location can be developed in a timely manner rather than waiting for a central sewer line to be extended.
2. Development density can also be increased by as much as 20% because homes can be sited on smaller lots than conventional systems require.
3. The presence of a publicly owned and operated sewer system is a selling point to homeowners.

ONSITE WASTEWATER SYSTEMS

The individual onsite septic system, consisting of a septic tank and drain field, has been the primary treatment and disposal system of domestic wastewater in rural areas in the New River Valley for many years. These systems, when properly situated, designed and maintained work well, but have a average life

of thirty (30) years due to the soils becoming clogged with particles created in the purification process. When the soil becomes clogged, the inadequately-treated wastewater in the drain field comes to the surface and may be washed into the stream during precipitation events. This type system failure is easily detected, and can be corrected although often at a high cost to the homeowner. The second type of failure is caused when the wastewater is washed through the soils so quickly that the bacteria is not killed. This failure type can occur either where the soil is highly permeable (beach sands) or where miniature subsurface fracturing exists (karst topography). This type of failure occurs underground and is difficult to detect. Ground water contamination can result if this type of septic system failure goes undetected, especially in concentrated communities. Ground water contamination is very expensive to clean up: therefore, prevention is essential to protecting this valuable natural resource.

VII. PRIORITIZATION

Scoring Criteria

Based on the existing needs and future sewer demands presented in this study, there is a significant need for sanitary sewer collection and treatment within the study area over the 20-year planning horizon. A need has been identified to rank the projects in order to maximize the benefits to the area.

Ranking criteria for centralized and decentralized sewer projects have been developed in order to assist in the prioritization of the proposed projects identified in this study. For centralized projects, these criteria were used in order to evaluate each project with respect to the number of households served, present worth per new residential connection, elimination of health hazards, elimination of water quality problems, available facilities, and residential / industrial growth potential. For decentralized projects, the criteria used to evaluate the projects were somewhat different and included elimination of health hazards, improvement to water quality, permitted water system, community involvement, utility willingness, financial support, and present worth cost per connection. The criteria employed for decentralized (DWS) projects differed from those used for centralized projects due to the fact that DWS projects are usually much smaller in scope and cost, they tend to be community-oriented projects, they do not always require discharge permits, and they are sometimes funded differently than centralized projects.

Each criterion was assigned a point value, which was used to measure how well a proposed project meets and/or addresses the intent of the criteria. A project could receive a maximum of 100 points if it meets or addresses all of the ranking criteria. Weighting factors are built in to each of the evaluation criteria based on their relative importance. The criteria were selected based on input from the Advisory Management Team and from funding agencies' existing methodologies for evaluating projects.

A threshold for determining primary priority projects was set at 65 out of 100 points for centralized sewer projects and 55 out of 100 for decentralized sewer projects. These thresholds were determined by the AMT by evaluating the number of projects falling above and below a given set of threshold values. After scoring of all identified projects and determining which were above the threshold value, it was determined that a project's affect on eliminating water quality and health hazards were a driving force in their designation as a primary priority.

CENTRALIZED SEWER PROJECTS

Number of Equivalent Customers Served by the Project (20 points)

The total number of equivalent customers served by the project will be evaluated for each project. Since one of the objectives of this study is to serve new customers, projects that serve more customers will receive more points.

This criterion shall be evaluated in accordance with the following point system:

< 25 equivalent connections	=	0 points
26 – 100 equivalent connections	=	5 points
101 – 200 equivalent connections	=	10 points
201 – 300 equivalent connections	=	15 points
> 300 equivalent connections	=	20 points

Present Worth Per Connection (20 points)

The cost of sewer system ownership can be separated into two categories. The first category is capital cost, which is the measure of the cost to install a new system. Capital costs are composed of hard costs and soft costs. Hard costs include the price of new materials and the cost to install them, while soft capital costs are those that are related to the construction costs such as engineering, legal, right-of-way, and administrative costs. A second cost of ownership of sewer systems is the annual operation and maintenance (O&M) costs. This is the continuous cost of operating the system and keeping it in good repair. The present worth analysis provides a convenient mechanism for accounting for all of the costs in the system analysis. Present Worth, as used in this report, is defined as the amount of money that must be placed on deposit today at 8% interest for 30 years to pay all of the capital and O&M costs for the planning period.

The total present worth of the project will be evaluated with respect to the potential number of connections that will be served by the proposed project. The lower the cost per connection the more points the project will receive under this criteria due to the fact that less grant funding is required the lower the per connection cost.

This criterion shall be evaluated in accordance with the following point system:

< \$15,000 per connection	=	20 points
\$15,001 - \$22,500 per connection	=	15 points
\$22,501 - \$30,000 per connection	=	10 points
\$30,001 - \$37,500 per connection	=	5 points
> \$37,501 per connection	=	0 points

Elimination of Health Hazards (15 points)

If a proposed project will minimize/eliminate VDH identified septic system failures, a maximum of 15 points will be awarded. If a proposed project is situated in an area with homes older than 30 years which rely of septic systems, 10 points will be awarded. Proposed projects which do not target an identified health hazard or an area with assumed septic issues will be awarded 0 points with respect to this criteria.

Elimination of Water Quality Problems (20 points)

If a proposed project is situated in the watershed and is within the vicinity (i.e., adjacent to the impaired water) of an impaired stream it will be awarded 20 points. If a proposed project is situated in the watershed but is not in the vicinity of an impaired stream it will be awarded 10 points. Proposed projects which are not in the watershed of an impaired stream will be awarded 0 points with respect to this criteria.

Available Facilities (10 points)

Available facilities considers whether a proposed project will be connected to an existing system or whether it will be connected to another proposed project. If a proposed project can be connected to an existing wastewater treatment plant / collection system without requiring modifications to the existing facilities it will be awarded 10 points. If modifications / upgrades are required to the existing wastewater treatment plant or collection system prior to construction of the new facilities, the project will be awarded 5 points. If proposed treatment facilities or collection systems must be constructed in order to provide a connection point for the project being evaluated, then 0 points will be awarded.

Residential / Industrial Growth Potential (15 points)

If a proposed project will provide sewer service to an area that will support future residential / industrial growth it will be awarded 15 points. If a proposed project will provide sewer service to an area that will only support future residential or industrial growth it will be awarded 10 or 5 points, respectively. A project that will provide little to no potential for growth of any significance will be given 0 points.

DECENTRALIZED SEWER PROJECTS

Elimination of Health Hazards (20 points)

Proposed projects that correct health hazards as identified by the Virginia Department of Health or are located in karst terrain as shown on maps provided by the Virginia Department of Conservation and Recreation will be evaluated in accordance with the following point system:

Identified septic failures	=	20 points
Contaminated ground water	=	20 points
Located in karst terrain	=	15 points
Known older homes (>30 years) with septic systems	=	10 points
No known health hazards	=	0 points

Elimination of Water Quality Problems (20 points)

This intent of this study, which is funded through Southern Rivers Water Quality Improvement Fund, is to supplement the efforts of the Department of Environmental Quality's Total Maximum Daily Loads (TMDL) Program whereby stream samples are taken and analyzed for fecal coliform bacteria, oxygen reduction, and other pollutants. This criterion also evaluates a project's potential for improving ground water quality where karst terrain exists. The karst criterion can be used to add points to projects that are located in an impaired watershed but not in vicinity of an impaired stream. Each proposed project will be evaluated according to published TMDL information using the following point system:

In an impaired watershed and in vicinity of impaired stream	=	20 points
In impaired watershed but not in vicinity of impaired stream	=	10 points
In karst terrain	=	5 points
Not in impaired watershed and not in vicinity of impaired stream	=	0 points

Permitted Water Source (5 points)

Since the county governments have recognized that septic systems can contaminate ground water, they have, for the most part, either installed public water systems or helped to get private drinking water systems permitted. If a proposed project currently has a permitted water system, 5 points will be awarded. Projects that have no permitted water system will be awarded 0 points. The existence of a permitted water system is important as it provides a way to insure customer payment of sewer bills. Some funding agencies will not provide money for sewer projects where there is no permitted water system.

Existing permitted water system or available within 1 year	=	5 points
Not available	=	0 points

Community Involvement (15 points)

Projects will be evaluated based on current community involvement in trying to solve their existing wastewater problems. Projects in communities demonstrating watershed group activities and organized citizen initiatives, including surveys, water quality monitoring, community meeting, etc., will be awarded 15 points. Projects in communities exhibiting evidence of citizen initiatives such as public meetings, requests for assistance, etc., will be awarded 10 points. Sometimes a project area may have an organized watershed group, but its efforts are focused on water quality issues other than wastewater pollution. In such a case, the project will only be awarded 5 points. Those communities not represented by a watershed group and not expressing interest in water quality will receive 0 points.

Organized citizen initiatives and watershed group activity	=	15 points
Organized citizen initiatives in improving water quality	=	10 points
Watershed group activity but not addressing wastewater	=	5 points
No watershed group or citizen initiative	=	0 points

Utility Willingness (10 points)

Utility willingness considers whether the local public service provider (city, town, or PSA) is willing to own and operate a decentralized system (DWS). This meets the qualifications of a Responsible Management Entity (RME) as set forth by the US Environmental Protection Agency in its Voluntary National Guidelines for Management of Onsite and Clustered (Decentralized) Wastewater Treatment Systems.

The criteria shall be evaluated in accordance with the following point system:

Utility has expressed a willingness to operate a DWS	=	10 points
Utility is unwilling to operate a DWS	=	0 points

Financial Support (10 points)

If a proposed project has had prior financial expenditures (planning, studies, etc.), or if funding has been requested or committed, it will be awarded 10 points. Projects that have shown no financial support will receive 0 points.

Present Worth Cost per Connection (20 points)

If a proposed project has a low present worth cost per connection (less than \$15,000) the project will be awarded 20 points. If a proposed project has a present worth cost per connection between \$15,001 - \$17,500, it will be awarded 10 points; and projects with a present worth cost per connection between \$17,501-\$20,000 will receive 5 points. Projects where the present worth cost per connection is greater than \$20,000, 0 points will be awarded.

<\$15,000 per connection	=	20 points
\$15,001-\$17,500 per connection	=	15 points
\$17,501-\$20,000 per connection	=	10 points
>\$20,000 per connection	=	0 points

VIII. FLOYD COUNTY

Seven centralized and five de-centralized projects have been defined to address water quality and service needs in Floyd County.

The centralized projects are associated with the Dodd Creek watershed and an expansion of the Floyd-Floyd County Public Service Authority wastewater service area. The de-centralized projects are located in areas of the county which have experienced localized population growth but remain well outside the serviceable area of the PSA.

EPPERLY MILL ROAD SEWER EXTENSION (F-4)

FLOYD COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Epperly Mill Road project area is located west of the Town of Floyd and extends primarily along U.S. Route 221 and State Routes 720. The project area includes approximately 35 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watersheds of Dodd Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth and a low to moderate potential for industrial/commercial growth.

Proposed Facilities

The proposed facilities associated with the Epperly Mill Road Sewer Extension include approximately 10,929 linear feet of 8-inch gravity sewer. The extension will connect to the existing Town of Floyd sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Floyd County Wastewater Treatment Plant (WWTP). The Town of Floyd WWTP has a permitted capacity of 0.15 million gallons per day (MGD) and currently treats an average of 0.095 MGD. Treated effluent from the Town of Floyd WWTP discharges into Dodd Creek which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 43 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 12,900 GPD or 0.013 MGD. Therefore, adequate capacity is available at the Town of Floyd WWTP to treat the anticipated wastewater generated in the Epperly Mill Road project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Epperly Mill Road Sewer Extension are \$1,223,120 and \$1,093, respectively. These costs result in an approximate present worth of \$35,300 per existing connection.

Existing Conditions:	65 homes and businesses on large lots.		Existing Conditions:	Onsite systems with low dense housing (20 homes per mile)	
Proposed Project:	Septic tank effluent gravity system proposed for this community. Use community treatment system and conventional drainfield. Secondary treatment system (FAST) would serve this area since soils are excellent for subsurface disposal.		Proposed Project:	Use Septic Tank Effluent Gravity (STEG) systems draining to a 10,000 GPD Treatment Facility serving 36 equivalent homes (ERCs) which includes church and elementary school. System could eventually be doubled in size to include MHP, county store , etc. along Route 642. Treatment system could be FAST (secondary) Treatment System with drainfield trenches. A small effluent pump station needed near Route 510.

Project Name:	Ripplemead Community Sewer Project (DC-6)	Project Name:	Snidertown Community Sewer Project (DC-8)																								
County:	Giles	County:	Giles																								
Type of Project:	Decentralized Wastewater System	Type of Project:	Decentralized																								
Utility Provider:	Giles County	Utility Provider:	Giles County																								
Responsible Mgmt Entity?	Giles County	Responsible Mgmt Entity?	Giles County																								
Existing Water System?	Public Water	Existing Water System?	Permitted System																								
Existing Conditions:	Old homes on small lots. Many issues with failures and odors. Central sewerage would require a grinder pump station and a couple of miles of force mains for central sewer. Poor clay soils adversely affect onsite disposal. Community established about 1950s.	Existing Conditions:	Several failures reported by Health Department. Sewer system badly needed.																								
Proposed Project:	Employ biofilter treatment system and uv disinfection and discharge into New River. Estimate of 105 gravity collection units and 35 pump systems required to flow to treatment system.	Proposed Project:	Combination of STEP/STEG collection. Treat to advanced secondary standard using biofilter. Disinfect and discharge to stream.

IX. GILES COUNTY

Sixteen centralized and seven de-centralized projects were identified to improve water quality and alleviate human health concerns in Giles County.

The centralized projects focus on expanding the service areas of existing wastewater systems managed by the towns within the county. Seven of the centralized projects run along the Route 460 corridor in the Sinking Creek watershed, as well as out toward the Newport area along State Highway 42. De-centralized projects in Giles County tend to be separated from the centralized projects by extreme topography, limiting the effectiveness and efficiency of connecting to a traditional wastewater system.

Primary Priorities

Centralized Projects

Project Name	Project Cost
Marville (G-1)	\$ 2,673,140
Route 100-Ingram Village/Oney/Mutter (G-2)	\$ 7,119,379
<i>Total</i>	\$ 9,792,519

Decentralized Projects

Project Name	Project Cost
Ripplemead (DC-6)	\$ 1,821,400

MARVILLE SEWER EXTENSION (G-1)

GILES COUNTY BOARD OF SUPERVISORS

New River Valley Planning District

Project Background

The Marville project area is located southwest of the Town of Narrows and extends primarily along State Route 61. The project area includes approximately 108 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watersheds of Wolf Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Marville Sewer Extension include approximately 23,138 linear feet of 8-inch gravity sewer. The extension will connect to the existing Town of Narrows sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Town of Narrows Wastewater Treatment Plant (WWTP). The Town of Narrows WWTP has a permitted capacity of 0.25 million gallons per day (MGD) and currently treats an average of 0.18 MGD. Treated effluent from the Town of Narrows WWTP discharges into the New River which is not identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 132 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 39,600 GPD or 0.04 MGD. Therefore, adequate capacity is available at the Town of Narrows WWTP to treat the anticipated wastewater generated in the Marville project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Marville Sewer Extension are \$2,673,140 and \$2,314, respectively. These costs result in an approximate present worth of \$24,992 per existing connection.

PRELIMINARY PROBABLE PROJECT COST

MARVILLE (G-1)
 GILES COUNTY BOARD OF SUPERVISORS
 New River Valley Planning District

ROUTE 100 – INGRAM VILLAGE/ONEY/MUTTER SEWER EXTENSION (G-2)

GILES COUNTY BOARD OF SUPERVISORS & TOWN OF PEARISBURG

New River Valley Planning District

Project Background

The Route 100 – Ingram Village/Oney/Mutter project area is located southwest of the Town of Pearisburg and extends primarily along State Routes 100, 622, and 665. The project area includes approximately 297 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watersheds of Walker Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Ingram Village/Oney/Mutter Sewer Extension include approximately 50,775 linear feet of 8-inch gravity sewer, 7,641 linear feet of 2-inch force main, and three grinder pump stations. The extension will connect to the existing Town of Pearisburg sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Town of Pearisburg Wastewater Treatment Plant (WWTP). The Town of Pearisburg WWTP has a permitted capacity of 0.275 million gallons per day (MGD) and currently treats an average of 0.19 MGD. Treated effluent from the Town of Pearisburg WWTP discharges into the New River which is not identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 362 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 108,600 GPD or 0.109 MGD. Therefore, adequate capacity is available at the Town of Pearisburg WWTP will require an upgrade to treat the anticipated wastewater generated in the Ingram Village/Oney/Mutter project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Ingram Village/Oney/Mutter Sewer Extension are \$7,119,379 and \$14,842, respectively. These costs result in an approximate present worth of \$24,534 per existing connection.

RIPPLEMEAD COMMUNITY SEWER PROJECT(DC-6)

GILES COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The large community of Ripplemead was developed around 1950, and uses conventional onsite septic systems. The older homes were built on small lots. The soil in this area consists of thick clays which have a slow percolation rate, thus requiring large drain fields. Septic system repairs are very expensive. This community is located in karst topography, with numerous sinkholes evident throughout. Central collection and treatment would require a grinder pump station and several miles of force main to get the wastewater to the Pearisburg sewage treatment plant. A plant expansion project would also be required to provide capacity for treatment. Because of the high cost of providing a central system, a decentralized system is recommended for this community. There are approximately 140 homes in this community.

Proposed Facilities

The proposed facilities associated with this project include 140 septic tanks with approximately 25% requiring pump packages to discharge into the main collection lines. The collection system would consist of 20,000 feet of small diameter effluent sewer line. The proposed treatment system is an AdvanTex AX100 Treatment System using six treatment modules, and UV disinfection system with discharge.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs are \$1,821,400 and \$33,540, respectively. These costs result in an approximate present worth of \$15,707 per existing connection.

PRELIMINARY PROBABLE PROJECT COST

FIGURE 13:
RIPPLEMEAD (DC-6)
GILES COUNTY BOARD OF SUPERVISORS
New River Valley Planning District

RAM WAYSIDE SEWER PROJECT (DC-7)

GILES COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

This community, often referred to as the Mullins Trailer Park, consists of several older mobile homes located on a steep hillside overlooking the New River just west of the Town of Rich Creek. Public water is available, but no public sewer. The lack of a public sewer system, poor soils, and the high costs of repairing failing onsite systems has caused a blighted condition in this community. Many of the mobile homes are abandoned, but without sewer there is no reason to remove the old trailers and replace with newer ones. The New River around Rich Creek has fishing, boating and camping activity during the warmer months, and would benefit from having an adequate sewer system for the Ram Wayside.

Proposed Facilities

The proposed facilities associated with constructing a decentralized sewage treatment system include approximately 5,200 linear feet of small diameter sewer lines for collection, and a three unit treatment system capable of handling 15,000 gallons per day. Because of the poor soil for disposing of the treated effluent onsite, a discharging system is recommended. This type of system would require the treated effluent to be disinfected before it could be discharged into the New River.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs are \$618,870 and \$12,000, respectively. These costs result in an approximate present worth of \$15,079 per existing connection.

SNIDERTOWN COMMUNITY SEWER PROJECT (DC-8)

GILES COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

This community is located beside Stony Creek and directly in front of the chemical lime plant on State Route 635. Stony Creek is a beautiful trout stream, but is receiving pollutants from the inadequate onsite septic systems in this community. Several failures have been reported to the Health Department. Stony Creek discharges into the New River just above the Ripplemead Community. There are 24 equivalent residential connections, which includes a church.

Proposed Facilities

The proposed facilities associated with this community system include approximately 7,000 linear feet of 4-inch gravity effluent sewer lines, 24 septic tanks, one-10,000 gallon per day treatment system with a permitted discharge.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with this decentralized wastewater system are \$407,400 and \$6,264, respectively. These costs result in an approximate present worth of \$19,913 per existing connection.

STAFFORDSVILLE COMMUNITY SEWER SYSTEM (DC-10)

GILES COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

Staffordsville is located in Giles County on Route 100 about four miles north of the Pulaski County line. It is situated on Walker Creek, a bacteria impaired stream which discharges into the New River between Pembroke and Pearisburg. This stream flows a long distance through karst areas with several significant caves present. These caves permit the ground water and surface waters to readily intermingle. This could potentially cause serious health problems since public water is not available in the community. The soils in the community of Staffordsville are slow to drain and are not conducive to long-life onsite septic systems. The project area includes Parcell Lane and the surrounding area above Route 100, and also the area between Route 100 and Walker Creek, which is accessed by the Cedar Lane Loop. The total project includes 40 homes and businesses.

Proposed Facilities

The proposed facilities associated with this project include approximately 9,000 feet of 4-inch effluent sewer line, with about an equal number of STEP and STEG Systems flowing into the main collection lines. A 10,000 gallon per day (gpd) treatment system is needed to treat the wastewater from the 40 residences and businesses. The proposed treatment would be provided by 2 AdvanTex AX100 Treatment Units, followed by a UV disinfection system with discharge into Walker Creek. This decentralized treatment system would be owned and operated by the Giles County PSA.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with this proposed system are \$597,800 and \$10,920, respectively. These costs result in an approximate present worth of \$18,018 per existing connection.

Existing Water System?	No	Existing Water System?	No																								
Existing Conditions:	The project area is currently not served by a public sewage system.	Existing Conditions:	This is a large community where the homes are generally on large lots, but the soils are not very good for onsite treatment and disposal. Wells are contaminated with bacteria.																								
Proposed Project:	The project consists of approximately 47,100 L.F. of 10-inch gravity sewer, 5,230 L.F. of 8-inch gravity sewer, 1,540 L.F. of 6 -inch force main, and one sewage pump station.	Proposed Project:	The existing 100 homes in the community could be served by using a STEG/STEP system at each home or business. Treatment would be provided by using an AdvanTex Treatment System followed by UV disinfection system before discharging into the unnamed tributary of the New River.																								
Existing WWTP:	<table border="1"> <tr><td>Name =</td><td>Peppers Ferry</td></tr> <tr><td>Design Flow (MGD)=</td><td>9 mgd</td></tr> <tr><td>Average Flow =</td><td>3.98 mgd</td></tr> <tr><td>Receiving Stream =</td><td>New River</td></tr> <tr><td>Stream Classification =</td><td>IV</td></tr> <tr><td>Impaired Stream</td><td>Yes</td></tr> </table>	Name =	Peppers Ferry	Design Flow (MGD)=	9 mgd	Average Flow =	3.98 mgd	Receiving Stream =	New River	Stream Classification =	IV	Impaired Stream	Yes	Existing WWTP:	<table border="1"> <tr><td>Name =</td><td>N/A</td></tr> <tr><td>Design Flow =</td><td></td></tr> <tr><td>Average Flow =</td><td></td></tr> <tr><td>Receiving Stream =</td><td></td></tr> <tr><td>Stream Classification =</td><td></td></tr> <tr><td>Impaired Stream</td><td></td></tr> </table>	Name =	N/A	Design Flow =		Average Flow =		Receiving Stream =		Stream Classification =		Impaired Stream

X. MONTGOMERY COUNTY

Fifty-nine centralized projects and one de-centralized project were identified in Montgomery County, addressing water quality and human health concerns.

The identified centralized projects focus on the areas previously identified by the County as growth areas for both wastewater services and population. The single de-centralized project identified, that also ranked out as a "Primary Priority" project, is in an area in the county that has experienced condensed population growth, but which is relatively removed from other wastewater service areas.

Primary Priorities

Centralized Projects

Project Name	Project Cost
Prices Fork (M-11)	\$ 3,015,500
Yellow Sulphur Road (M-12)	\$ 1,755,200
Pepper's Ferry Road-Vicker's Switch (M-13)	\$ 2,051,300
Pepper's Ferry Road- Coal Hollow Rd (M-15)	\$ 573,900
NW Rt. 460 By-pass (M-16)	\$ 3,094,700
Riner Phase I (M-20)	\$ 3,676,800
Shawsville (M-23)	\$ 2,271,300
Ironto (M-24)	\$ 2,472,800
<i>Total</i>	<i>\$ 18,911,500</i>

De-centralized Projects

Project Name	Project Cost
McCoy (DC-13)	\$ 1,347,500
<i>Total</i>	<i>\$ 1,347,500</i>

Secondary Priorities

Centralized Projects

Project Name	Project Cost
Cedar Run (M-1)	\$ 5,115,400
Luster's Gate (M-2)	\$ 4,031,890
Luster's Gate (M-3)	\$ 3,350,700
Luster's Gate (M-4)	\$ 2,074,300
Luster's Gate (M-5)	\$ 2,944,400
Indian Run (M-6)	\$ 4,798,600
Merrimac Phase 1 (M-7)	\$ 4,411,700
Merrimac Phase 2 (M-8)	\$ 4,007,200
Merrimac Phase 3 (M-9)	\$ 2,269,300
Merrimac Phase 4 (M-10)	\$ 3,701,300
Dominion Dr/Crab Creek Rd (M-14)	\$ 3,816,500
Radford Rd. (M-17)	\$ 3,071,300
Mud Pike (M-18)	\$ 5,490,300
Flanagan Dr (M-19)	\$ 2,432,000
Riner Phase 2 (M-21)	\$ 2,746,300
Falling Branch Rd (M-22)	\$ 945,600
Brush Mtn Phase 1 (M-25)	\$ 4,949,000
Brush Mtn Phase 2 (M-26)	\$ 3,323,400
Brush Mtn Phase 3 (M-27)	\$ 3,368,300
Brush Mtn Phase 4 (M-28)	\$ 4,735,900
Brush Mtn Phase 5 (M-29)	\$ 4,599,600
Brush Mtn Phase 6 (M-30)	\$ 4,023,800
Multiple Town of Christiansburg Line Replacements (M-31 to M-58)	\$ 5,810,560
Graysontown (M-59)	\$ 6,502,580
<i>Total</i>	<i>\$ 92,519,930</i>

De-centralized Projects

FIGURE 26:
MONTGOMERY COUNTY PROJECT AREAS
New River Valley Planning District

PRICES FORK SEWER EXTENSION (M-11)
MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY
New River Valley Planning District

Project Background

The Prices Fork project area is located to the west of the Town of Blacksburg and extends primarily along State Route 685. The project area includes approximately 125 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Stroubles Creek and Tom's Creek, both of which have been identified by the Virginia Department of Environmental Quality (DEQ) as impaired streams. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Prices Fork Sewer Extension include approximately 18,600 L.F. of 8-inch gravity sewer, 3,200 L.F. of 4-inch force main, 5,500 L.F. of 2-inch force main, one (1) sewage pump station, and two (2) grinder pump stations. The extension will connect to the existing sanitation authority sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Blacksburg-VPI Sanitation Authority Wastewater Treatment Plant (WWTP). The Blacksburg-VPI Sanitation Authority WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 4.8 MGD. Treated effluent from the Blacksburg-VPI Sanitation Authority WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 153 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 45,900 GPD or 0.046 MGD. Therefore, adequate capacity is available at the Blacksburg-VPI Sanitation Authority WWTP to treat the anticipated wastewater generated in the Prices Fork project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Prices Fork Sewer Extension are \$3,015,500 and \$13,730, respectively. These costs result in an approximate present worth of \$25,370 per existing connection.

YELLOW SULPHUR ROAD-TOWN OF CHRISTIANSBURG SEWER EXTENSION (M-12)

MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Yellow Sulphur Road project area is located to the east of the Town of Christiansburg and extends primarily along State Route 643. The project area includes approximately 42 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Wilson Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth and a moderate potential will exist for industrial/commercial growth.

Proposed Facilities

The proposed facilities associated with the Yellow Sulphur Road Sewer Extension include approximately 14,300 L.F. of 8-inch gravity sewer, 2,700 L.F. of 2-inch force main, and one (1) grinder pump station. The extension will connect to the existing Town of Christiansburg sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Town of Christiansburg Wastewater Treatment Plant (WWTP). The Town of Christiansburg WWTP has a permitted capacity of 4.0 million gallons per day (MGD) and currently treats an average of 2.0 MGD. Treated effluent from the Town of Christiansburg WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 52 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 15,600 GPD or 0.016 MGD. Therefore, adequate capacity is available at the Town of Christiansburg WWTP to treat the anticipated wastewater generated in the Yellow Sulphur Road project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Yellow Sulphur Road Sewer Extension are \$1,755,200 and \$4,700, respectively. These costs result in an approximate present worth of \$43,060 per existing connection.

PRELIMINARY PROBABLE PROJECT COST

Construction Cost

14,300	L.F.	8" Gravity Sewer @	\$80/L.F.	\$1,144,000

PEPPERS FERRY ROAD-CHRISTIANSBURG WEST TO VICKER SWITCH ROAD SEWER EXTENSION (M-13)

MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Peppers Ferry Road-Christiansburg West to Vicker Switch Road- project area is located west of the Town of Christiansburg and extends primarily along State Route 114. The project area includes approximately 118 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Slate Branch and Crab Creek, both of which have been identified by the Virginia Department of Environmental Quality (DEQ) as impaired streams. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Peppers Ferry Road-Christiansburg West to Vicker Switch Road Sewer Extension include approximately 10,100 L.F. of 8-inch gravity sewer, 16,000 L.F. of 4-inch force main, 6,900 L.F. of 2-inch force main, one (1) sewage pump stations, and one (1) grinder pump station. The extension will connect to the existing sanitation authority sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Town of Christiansburg Wastewater Treatment Plant (WWTP). The Town of Christiansburg WWTP has a permitted capacity of 4.0 million gallons per day (MGD) and currently treats an average of 2.0 MGD. Treated effluent from the Town of Christiansburg WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 144 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 43,200 GPD or 0.043 MGD. Therefore, adequate capacity is available at the Town of Christiansburg WWTP to treat the anticipated wastewater generated in the Peppers Ferry Road-Christiansburg West to Vicker Switch Road project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Peppers Ferry Road-Christiansburg West to Vicker Switch Road Sewer Extension are \$2,051,300 and \$10,020, respectively. These costs result in an approximate present worth of \$18,340 per existing connection.

PEPPERS FERRY ROAD - COAL HOLLOW ROAD TO MCCORMICK ROAD SEWER EXTENSION (M-15)

MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Peppers Ferry Road - Coal Hollow Road to McCormick Road project area is located to the east of the community of Centerville and extends primarily along State Route 114. The project area includes approximately 26 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Stroubles Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Peppers Ferry Road - Coal Hollow Road to McCormick Road Sewer Extension include approximately 4,900 L.F. of 8-inch gravity sewer. The extension will connect to the existing sanitation authority sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Blacksburg-VPI Sanitation Authority Wastewater Treatment Plant (WWTP). The Blacksburg-VPI Sanitation Authority WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 4.8 MGD. Treated effluent from the Blacksburg-VPI Sanitation Authority WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 32 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 9,600 GPD or 0.01 MGD. Therefore, adequate capacity is available at the Blacksburg-VPI Sanitation Authority WWTP to treat the anticipated wastewater generated in the Peppers Ferry Road - Coal Hollow Road to McCormick Road project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Peppers Ferry Road - Coal Hollow Road to McCormick Road Sewer Extension are \$573,900 and \$490, respectively. These costs result in an approximate present worth of \$22,290 per existing connection.

NW ROUTE 460 BY-PASS - ELLETT ROAD SEWER EXTENSION (M-16)

MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY
New River Valley Planning District

Project Background

The Route 460 By-Pass - Ellett Road project area is located to the east of the Town of Christiansburg and extends primarily along State Route 723. The project area includes approximately 115 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Wilson Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth and a moderate potential will exist for industrial/commercial growth.

Proposed Facilities

The proposed facilities associated with the Route 460 By-Pass - Ellett Road Sewer Extension include approximately 18,800 L.F. of 8-inch gravity sewer, 8,500 L.F. of 4-inch force main, 5,000 L.F. of 2-inch force main, one (1) sewage pump station, and one (1) sewage pump stations. The extension will connect to the existing Town of Christiansburg sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Town of Christiansburg Wastewater Treatment Plant (WWTP). The Town of Christiansburg WWTP has a permitted capacity of 4.0 million gallons per day (MGD) and currently treats an average of 2.0 MGD. Treated effluent from the Town of Christiansburg WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 141 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 42,300 GPD or 0.042 MGD. Therefore, adequate capacity is available at the Town of Christiansburg WWTP to treat the anticipated wastewater generated in the Route 460 By-Pass - Ellett Road project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Route 460 By-Pass - Ellett Road Sewer Extension are \$3,094,700 and \$11,230, respectively. These costs result in an approximate present worth of \$28,010 per existing connection.

RINER PHASE I-FAIRVIEW CHURCH RD. NORTH OF UNION VALLEY RD. SEWER EXTENSION (M-20)

MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Riner Phase I-Fairview Church Rd. North of Union Valley Rd. project area is located within and north of the community of Riner and extends primarily along State Routes 8, 669, and 671. The project area includes approximately 149 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Mill Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Riner Phase I-Fairview Church Rd. North of Union Valley Rd. Sewer Extension include approximately 27,400 L.F. of 8-inch gravity sewer, 500 L.F. of 6-inch gravity sewer, 2,400 L.F. of 4-inch force main, and one (1) sewage pump station. The extension will connect to the existing community of Riner sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Community of Riner Wastewater Treatment Plant (WWTP). The Community of Riner WWTP has a permitted capacity of 0.1 million gallons per day (MGD) and currently treats an average of 0.022 MGD. Treated effluent from the Community of Riner WWTP discharges into the Mill Creek which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 182 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 54,600 GPD or 0.055 MGD. Therefore, adequate capacity is available at the Community of Riner WWTP to treat the anticipated wastewater generated in the Riner Phase I-Fairview Church Rd. North of Union Valley Rd. project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Riner Phase I-Fairview Church Rd. North of Union Valley Rd. Sewer Extension are \$3,676,800 and \$8,030, respectively. These costs result in an approximate present worth of \$25,290 per existing connection.

SHAWSVILLE SEWER EXTENSION (M-23)
MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY
New River Valley Planning District

Project Background

The Shawsville project area is located northeast of the Community of Shawsville and extends primarily along U.S. Route 11/460 and State Route 633. The project area includes approximately 172 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watersheds of South Fork Roanoke River and Spring Branch, which have been identified by the Virginia Department of Environmental Quality (DEQ) as impaired streams. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Shawsville Sewer Extension includes approximately 15,400 L.F. of 8-inch gravity sewer, 700 L.F. of 2-inch force main, and one (1) grinder pump station. The extension will connect to the existing Community of Shawsville sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Shawsville Wastewater Treatment Plant (WWTP). The Shawsville WWTP has a permitted capacity of 0.2 million gallons per day (MGD) and currently treats an average of 0.053 MGD. Treated effluent from the Shawsville WWTP discharges into the South Fork Roanoke River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 210 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 63,000 GPD or 0.063 MGD. Therefore, adequate capacity is available at the Shawsville WWTP to treat the anticipated wastewater generated in the Shawsville project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Shawsville Sewer Extension are \$2,271,300 and \$4,610, respectively. These costs result in an approximate present worth of \$13,510 per existing connection.

Present Worth Per Connection:	\$13,510	

IRONTO/I81 EXIT 128/I81 EXIT 128 – BUILDOUT EXISTING SERVICE AREA (M-24)

MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Ironto/I81 Exit 128 project area is located to the east and south of the community of Elliston and extends primarily along U.S. Route 460 and State Route 631. The project area includes approximately 79 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of the South and North Forks of the Roanoke River, both of which have been identified by the Virginia Department of Environmental Quality (DEQ) as impaired streams. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth, and a moderate potential will exist for industrial/commercial growth.

Proposed Facilities

The proposed facilities associated with the Ironto/I81 Exit 128-Buildout Existing Service Area project includes approximately 14,700 L.F. of 8-inch gravity sewer, 1,200 L.F. of 6-inch gravity sewer, 3,400 L.F. of 2-inch force main, and three (3) grinder pump stations. The extension will connect to the existing community of Elliston sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Elliston-Lafayette Wastewater Treatment Plant (WWTP). The Elliston-Lafayette WWTP has a permitted capacity of 0.25 million gallons per day (MGD) and currently treats an average of 0.058 MGD. Treated effluent from the Elliston-Lafayette WWTP discharges into the South Fork Roanoke River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 97 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 29,100 GPD or 0.029 MGD. Therefore, adequate capacity is available at the Elliston-Lafayette WWTP to treat the anticipated wastewater generated in the Ironto/I81 Exit 128 project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Ironto/I81 Exit 128-Buildout Existing Service Area project are \$2,472,800 and \$10,930, respectively. These costs result in an approximate present worth of \$32,860 per existing connection.

PRELIMINARY PROBABLE PROJECT COST

 (M-24)
 MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY
 New River Valley Planning District

McCOY COMMUNITY SEWER SYSTEM (DC-13)

MONTGOMERY COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

McCoy is located in a beautiful section of Montgomery County, across the New River from the Radford Army Ammunition Plant, and roughly 9 miles from the Virginia Tech campus in Blacksburg. Public water and sewer are not available in this community, and ground water contamination has been reported recently. All the homes are served by individual onsite septic systems, which is not desirable in densely populated areas with karst conditions.

Proposed Facilities

The proposed facilities associated with a decentralized wastewater system serving 100 homes includes approximately 24,000 linear feet of effluent sewer line. The lines would range from 6-inch gravity sewers to 2-inch force main. Approximately 10% of the septic tanks at the 100 homes would require pump packages due to the rolling terrain. The treatment system would require 4-AX100 modules to treat the 20,000 gallons per day of wastewater generated. An ultraviolet (UV) disinfection system would be required prior to discharging into the stream.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with this system are \$1,347,500 and \$23,400, respectively. These costs result in an approximate present worth of \$16,109 per existing connection.

PRELIMINARY PROBABLE PROJECT COST

PROJECT DATA SHEET

Table 169

Project Name: Painters Woods Subdivision (DC-18)

County: Pulaski

Type of Project: Decentralized Wastewater System

Utility Provider: Pulaski County

Responsible Mgmt Entity? Pulaski County

Existing Water System? Yes

Existing Conditions: 70 homes on medium size lots. Poor draining soils with lots of septic tank failures. Nice homes older than 30 years of age. Karst terrain.

Proposed Project: Septic tank effluent gravity system proposed for this community. Use community treatment system with UV disinfection and discharge into stream. Three (3) AdvanTex Ax100 Treatment Units required.

Existing WWTP: Name =	N/A
Design Flow =	
Average Flow =	
Receiving Stream =	
Stream Classification =	
Impaired Stream	

Watershed or Adjacent Stream: Name =	Unnamed Tributary
Impaired =	No
Within Vicinity =	No

Equivalent Customers Served: Residential =	70
Industrial	0
Commercial =	0

Health Hazard: Groundwater Contaminated

Construction Feasibility: WWTP/Collection System Available	No
WWTP/Collection System Upgrades Required	
WWTP/Collection System Not Available	

Growth Potential: Three other small clusters of homes nearby, including the Draper Valley Presbyterian Church. These communities could be served by a slightly larger treatment system.

Total Project Cost: \$770,000

Present Worth Per Connection: \$13,625

Table 170

Project Name: McCarthy Road Subdivision (DC-14)

County: Pulaski

Type of Project: Decentralized Wastewater System

Utility Provider: Pulaski County

Responsible Mgmt Entity? Pulaski County

Existing Water System? No

Existing Conditions: 20 homes on 3/4-ac. relatively flat lake lots. High water table.

Proposed Project: Septic tank effluent pump system proposed for this community. Use community treatment/drainfield back away from lake. One (1) Advantex AX100 Treatment System would serve this area from a pasture field where a suitable drip disposal may be found.

PROJECT DATA SHEET

Table 171													
Project Name:	DeHaven Park/Owens Road Sewer System (DC-15)												
County:	Pulaski												
Type of Project:	Decentralized												
Utility Provider:	Pulaski County												
Responsible Mgmt Entity?	Pulaski County												
Existing Water System?	No												
Existing Conditions:	DeHaven Park has 90 Homes on 1/4-acre lots and there are 20 lake front homes also located on small lots further north on Owens Road. Lots are too small to accommodate wells and adequately sized onsite disposal systems.												
Proposed Project:	Use Septic Tank Effluent Pump (STEP) systems pumping to a 20,000 GPD Treatment Facility (serving 100 homes) with discharge into Claytor Lake. The treatment plant could eventually be doubled in size which would serve all lake property along Owens Road. Water quality limits will probably be stringent since the discharge is directly into Claytor Lake. Membrane Bioreactor (MBR) Plant will likely be required.												
Existing WWTP:	<table border="1"> <tr><td>Name =</td><td>N/A</td></tr> <tr><td>Design Flow =</td><td></td></tr> <tr><td>Average Flow =</td><td></td></tr> <tr><td>Receiving Stream =</td><td></td></tr> <tr><td>Stream Classification =</td><td></td></tr> <tr><td>Impaired Stream</td><td></td></tr> </table>	Name =	N/A	Design Flow =		Average Flow =		Receiving Stream =		Stream Classification =		Impaired Stream

XI. PULASKI COUNTY

Thirty-four centralized and five de-centralized projects addressing water quality and human health issues were identified in Pulaski County.

The centralized projects focused on growth areas between and to the north of the Towns of Dublin and Pulaski. Several centralized projects also focused on areas developing around exits from I81. The de-centralized project areas are located on the south side of Claytor Lake, an area where the cost of extending centralized systems is prohibitively expensive.

Primary Priorities

Centralized Projects

Project Name	Project Cost
Thorne Spring Branch Phase 1 (P-1)	\$ 4,130,660
Alum Spring Rd Phase 1 (P-4)	\$ 3,565,800
Pondlick Branch/Mt Olivet Phase 1 (P-9)	\$ 3,794,500
Rt 100 Dublin/Commerce Park (P-12)	\$ 5,870,360
Back Creek Area (P-13)	\$ 4,219,940
East Dublin/Stoneridge Dr (P-14)	\$ 5,246,740
Belspring/Gate 10 Rd (P-16)	\$ 4,067,870
North Claytor Lake (P-21)	\$ 4,343,695
South Dublin (P-33)	\$ 2,238,040
<i>Total</i>	<i>\$ 37,477,6057</i>

De-centralized Projects

Project Name	Project Cost
Painters Woods (DC-18)	\$ 770,000
<i>Total</i>	<i>\$ 770,000</i>

Secondary Priorities

Centralized Projects

Project Name	Project Cost
Thorne Spring Branch Phase 2 (P-2)	\$ 4,786,550
Thorne Spring Branch Phase 3 (P-3)	\$ 4,968,800
Alum Spring Rd Phase 2 (P-5)	\$ 4,722,660
Robinson Tract Rd Phase 1 (P-6)	\$ 4,783,760
Robinson Tract Rd Phase 2 (P-7)	\$ 5,092,100
Brookmont Rd (P-8)	\$ 5,734,260
Pondlick Branch/Mt Olivet Phase 2 (P-10)	\$ 4,914,420

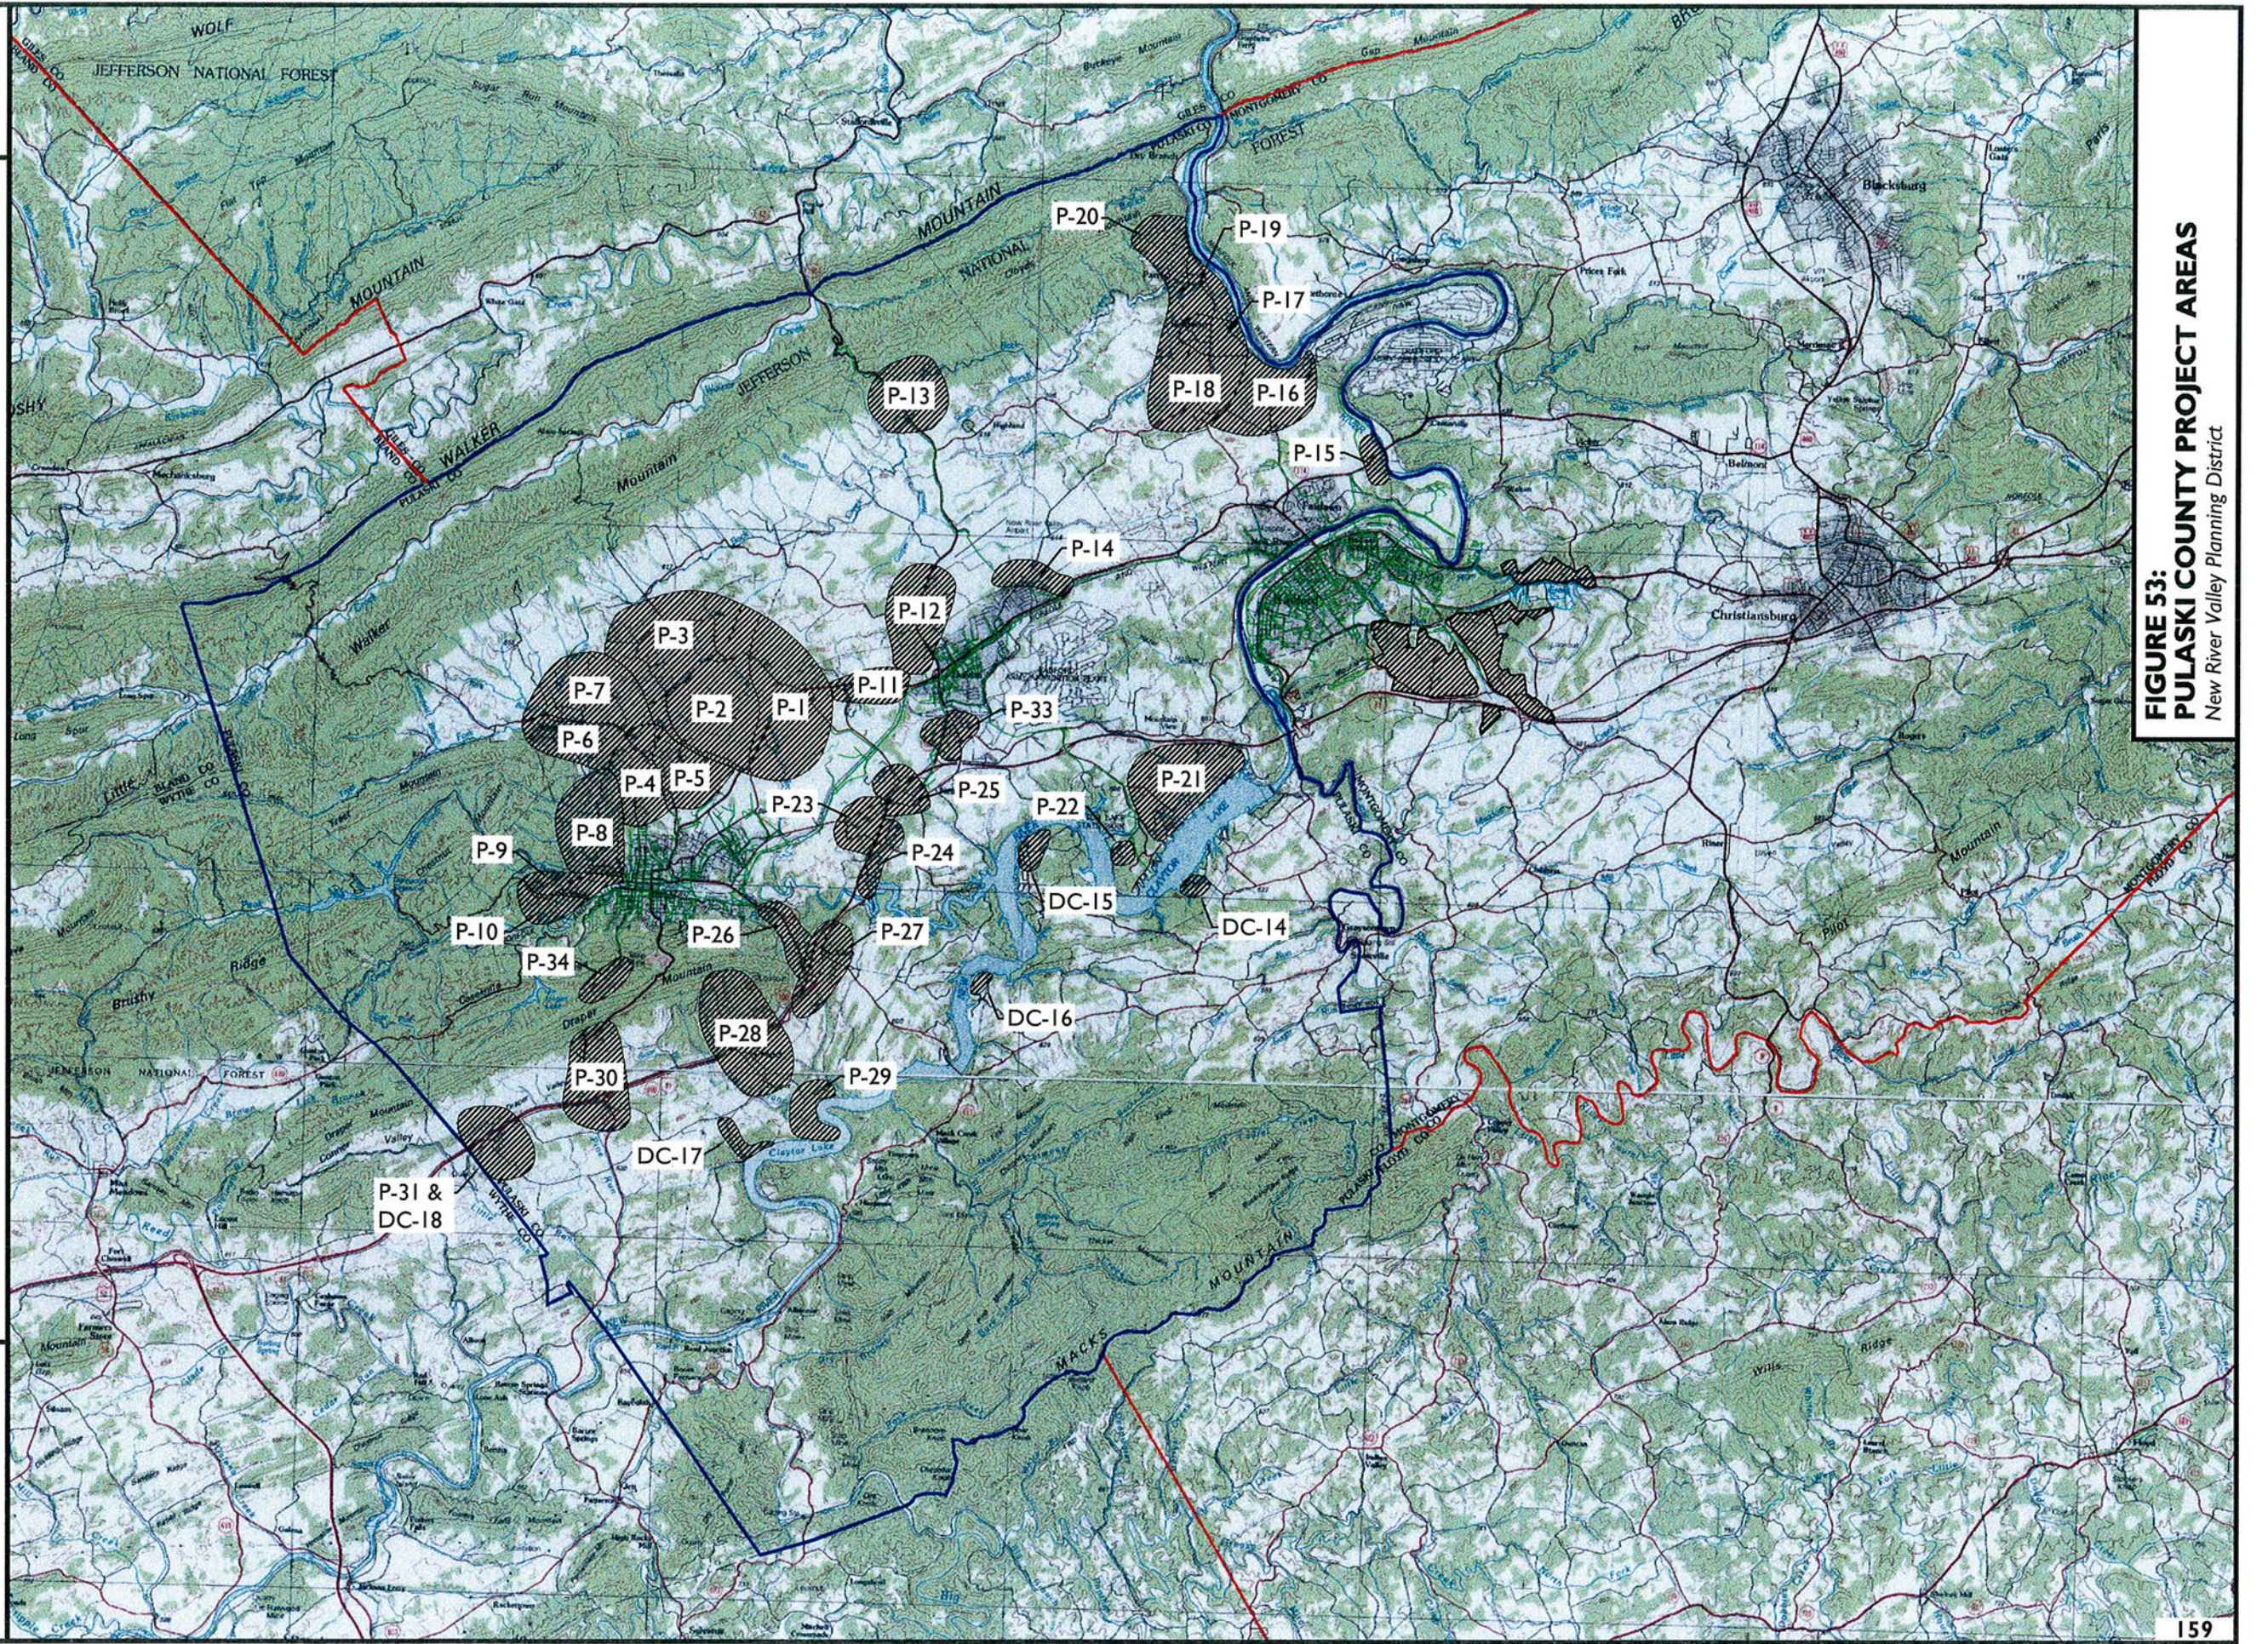

FIGURE 53:
PULASKI COUNTY PROJECT AREAS
New River Valley Planning District

THORNE SPRING BRANCH PHASE I SEWER EXTENSION (P-I)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Thorne Spring Branch Phase I project area is located northeast of the Town of Pulaski and extends primarily along U.S. Route 11. The project area includes approximately 212 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Thorne Spring Branch which discharges into Peak Creek, Peak Creek has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth and a moderate potential will exist for commercial/industrial growth.

Proposed Facilities

The proposed facilities associated with the Thorne Spring Branch Phase I Sewer Extension include approximately 8,985 linear feet of 12-inch gravity sewer and 23,900 linear feet of 8-inch gravity sewer. The extension will connect to the existing Town of Pulaski sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 259 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 77,700 GPD or 0.078 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the Thorne Spring Branch Phase I project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Thorne Spring Branch Phase I Sewer Extension are \$4,130,660 and \$3,289, respectively. These costs result in an approximate present worth of \$19,658 per existing connection.

FIGURE 54:
THORNE SPRING BRANCH PHASE I (P-1)
PULASKI COUNTY PUBLIC SERVICE AUTHORITY
New River Valley Planning District

ALUM SPRING ROAD PHASE I SEWER EXTENSION (P-4)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Alum Spring Road Phase I project area is located north of the Town of Pulaski and extends primarily along State Route 636. The project area includes approximately 219 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of an unnamed tributary which discharges into Peak Creek, Peak Creek has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Alum Spring Road Phase I Sewer Extension include approximately 8,000 linear feet of 10-inch gravity sewer, 19,610 linear feet of 8-inch gravity sewer, and 750 linear feet of 6-inch gravity sewer. The extension will connect to the existing Town of Pulaski sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 268 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 80,400 GPD or 0.081 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the Alum Spring Road Phase I project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Alum Spring Road Phase I Sewer Extension are \$3,565,800 and \$2,836, respectively. These costs result in an approximate present worth of \$16,428 per existing connection.

PONDCLICK BRANCH/MOUNT OLIVET PHASE I SEWER EXTENSION (P-9)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Pondlick Branch/Mount Olivet Phase I project area is located west of the Town of Pulaski and extends primarily along State Routes 640 and 710. The project area includes approximately 126 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Peak Creek, which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Pondlick Branch/Mount Olivet Phase I Sewer Extension include approximately 4,400 linear feet of 12-inch gravity sewer and 22,275 linear feet of 8-inch gravity sewer. The extension will connect to the existing Town of Pulaski sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 154 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 46,200 GPD or 0.046 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the Pondlick Branch/Mount Olivet Phase I project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Pondlick Branch/Mount Olivet Phase I Sewer Extension are \$3,794,500 and \$5,668, respectively. These costs result in an approximate present worth of \$30,621 per existing connection.

PONDLIICK BRANCH/MOUNT OLIVET PHASE I (P-9)
 PULASKI COUNTY PUBLIC SERVICE AUTHORITY
 New River Valley Planning District

ROUTE 100 - DUBLIN/COMMERCE PARK SEWER EXTENSION (P-12)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Route 100 - Dublin/Commerce Park project area is located northeast of the Town of Dublin and extends primarily along U.S. Route 11 and State Routes 100, 636, and 746. The project area includes approximately 208 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watersheds of Back Creek, Peak Creek, and the New River, which have been identified by the Virginia Department of Environmental Quality (DEQ) as impaired streams. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth, and a moderate to high potential will exist for industrial/commercial growth.

Proposed Facilities

The proposed facilities associated with the Route 100 - Dublin/Commerce Park Sewer Extension include approximately 43,410 linear feet of 8-inch gravity sewer, 7,100 linear feet of 2-inch force main, and two grinder pump stations. The extension will connect to the existing Town of Dublin sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 252 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 75,600 GPD or 0.076 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the Route 100 - Dublin/Commerce Park project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Route 100 - Dublin/Commerce Park Sewer Extension are \$5,870,360 and \$15,051, respectively. These costs result in an approximate present worth of \$29,040 per existing connection.

BACK CREEK SEWER EXTENSION (P-13)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Back Creek project area is located north of the Town of Dublin at the Base of Walker Mountain and extends primarily along State Route 100. The project area includes approximately 120 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Back Creek which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Back Creek Sewer Extension includes approximately 4,170 linear feet of 10-inch gravity sewer, 29,180 linear feet of 8-inch gravity sewer, 1,470 linear feet of 4-inch force main, and one sewage pump station. The extension will connect to the existing Pulaski County PSA sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 143 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 42,600 GPD or 0.043 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the Back Creek project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Back Creek Sewer Extension are \$4,219,940 and \$8,482, respectively. These costs result in an approximate present worth of \$35,970 per existing connection.

EAST DUBLIN/STONERIDGE DRIVE SEWER EXTENSION (P-14)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The East Dublin/Stoneridge Drive project area is located east of the Town of Dublin and extends primarily along U.S. Route 11. The project area includes approximately 427 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of Hazel Hollow which discharges into the New River which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the East Dublin/Stoneridge Drive Sewer Extension includes approximately 6,510 L.F. of 10-inch gravity sewer, 29,525 L.F. of 8-inch gravity sewer, 1,420 L.F. of 4-inch force main, and one sewage pump station. The extension will connect to the existing Pulaski County Public Service Authority sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 522 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 156,600 GPD or 0.092 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the East Dublin/Stoneridge Drive project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the East Dublin/Stoneridge Drive Sewer Extension are \$5,246,740 and \$8,746, respectively. These costs result in an approximate present worth of \$12,518 per existing connection.

EAST DUBLIN/STONERIDGE DRIVE (P-14)
 PULASKI COUNTY PUBLIC SERVICE AUTHORITY
 New River Valley Planning District

BELSPRING/GATE 10 ROAD SEWER EXTENSION (P-16)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Belspring/Gate 10 Road project area is located north of the community of Fairlawn and extends primarily along State Routes 600 and 623. The project area includes approximately 133 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of the New River which has been identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the Belspring/Gate 10 Road Sewer Extension includes approximately 1,980 L.F. of 15-inch gravity sewer, 20,900 L.F. of 8-inch gravity sewer, 7,185 L.F. of 6-inch force main, 6,825 L.F. of 2-inch force main, two grinder pump stations, and two sewage pump stations. The extension will connect to the existing Pulaski County Public Service Authority sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 163 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 48,900 GPD or 0.05 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the Belspring/Gate 10 Road project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the Belspring/Gate 10 Road Sewer Extension are \$4,067,870 and \$19,689, respectively. These costs result in an approximate present worth of \$32,252 per existing connection.

NORTH CLAYTOR LAKE SEWER EXTENSION (P-21)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The North Claytor Lake project area is located southeast of the Town of Dublin and extends primarily along State Route 660. The project area includes approximately 257 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of the Claytor Lake which is not identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the North Claytor Lake Sewer Extension includes approximately 3,835 L.F. of 10-inch gravity sewer, 14,225 L.F. of 8-inch gravity sewer, 11,495 L.F. of 4-inch force main, 7,185 L.F. of 2-inch force main, two grinder pump station and three sewage pump stations. The extension will connect to the existing Pulaski County Public Service Authority sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 316 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 94,200 GPD or 0.094 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the North Claytor Lake project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the North Claytor Lake Sewer Extension are \$4,343,695 and \$24,674, respectively. These costs result in an approximate present worth of \$17,982 per existing connection.

SOUTH DUBLIN SEWER EXTENSION (P-33)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The South Dublin project area is located south of the Town of Dublin and extends primarily along State Routes 100 and 682. The project area includes approximately 167 residential connections. Currently, the area is not served by a public sewage system. Residences in the area primarily utilize privately owned and maintained on-site septic systems. The project area lies in the watershed of the Claytor Lake which is not identified by the Virginia Department of Environmental Quality (DEQ) as an impaired stream. It is anticipated that, with the provision of public sewage service, a moderate to high potential will exist for residential growth.

Proposed Facilities

The proposed facilities associated with the South Dublin Sewer Extension include approximately 4,080 L.F. of 10-inch gravity sewer and 13,065 L.F. of 8-inch gravity sewer. The extension will connect to the existing Town of Dublin sewage collection system and all wastewater generated in the project area will ultimately be conveyed to and treated at the existing Peppers Ferry Wastewater Treatment Plant (WWTP). The Peppers Ferry WWTP has a permitted capacity of 9.0 million gallons per day (MGD) and currently treats an average of 3.98 MGD. Treated effluent from the Peppers WWTP discharges into the New River which has been identified by DEQ as an impaired stream. Based on a 50-year design period, a potential future customer base of 204 connections (anticipated 50-year growth of 20%) and a flow of 300 gallons per day (GPD) per connection, future average daily flow for the project area will be approximately 61,200 GPD or 0.061 MGD. Therefore, adequate capacity is available at the Peppers Ferry WWTP to treat the anticipated wastewater generated in the South Dublin project area.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with the South Dublin Sewer Extension are \$2,228,040 and \$1,715, respectively. These costs result in an approximate present worth of \$13,517 per existing connection.

PAINTERS WOODS SUBDIVISION SEWER SYSTEM (DC-18)

PULASKI COUNTY PUBLIC SERVICE AUTHORITY

New River Valley Planning District

Project Background

The Painters Woods Subdivision is located just off the service road paralleling the northbound lane of Interstate 81 in Pulaski County very near the Wythe County Line. The project area includes 70 residential connections. The distance of this community from the nearest conventional sewer line makes it hard to serve, and poor draining soils and karst terrain makes the community a prime candidate for a decentralized collection and treatment system. Onsite septic systems have short lives, and some of the residences have systems that have been repaired two times. The project area drains to Little Pine Run, a tributary of New River.

Proposed Facilities

The proposed treatment is a 15,000 gallon per day AdvanTex AX100 system, which uses a man-made textile fabric for the media. Since the soils are poor draining clays, an ultraviolet disinfection system/discharging system is proposed. The effluent collection system consists of a water-tight septic tank on each lot flowing by gravity to a collection system consisting of approximately 7,300 linear feet of small diameter effluent sewer lines. Since the proposed system discharges to the stream, a discharge permit will be required from the Virginia Department of Environmental Quality. The permit must be renewed every 5 years.

Project Costs

The preliminary probable project cost and annual operation and maintenance costs associated with operating the system by the Pulaski County PSA are \$770,000 and \$16,320, respectively. These costs result in an approximate present worth of \$13,625 per existing connection.

PRELIMINARY PROBABLE PROJECT COST

<u>Construction Cost</u>				
70	EA.	STEG Systems	\$3,000	\$210,000
6,300	LF	4" Sewer Line	\$10	\$63,000
1,000	LF	6" Sewer Line	\$14	\$14,000
15	EA.	Road Crossings	\$2,000	\$30,000
15,000	Gal.	Treatment System - AX100	\$10	\$150,000
12,000	Gal.	Treatment Tanks	\$1.50	\$18,000

Table 134 - PROJECT DATA SHEET

Project Name:	Painters Woods Subdivision	
County:	Pulaski	
Type of Project:	Decentralized Wastewater System	
Utility Provider:	Pulaski County	
Responsible Mgmt Entity?	Pulaski County	
Existing Water System?	Yes	
Existing Conditions:	70 homes on medium size lots. Poor draining soils with lots of septic tank failures. Nice homes older than 30 years of age. Karst terrain.	
Proposed Project:	Septic tank effluent gravity system proposed for this community. Use community treatment system with UV disinfection and discharge into stream. Three (3) AdvanTex Ax100 Treatment Units required.	
Existing WWTP:	Name =	N/A
	Design Flow =	
	Average Flow =	
	Receiving Stream =	
	Stream Classification = Impaired Stream	
Watershed or Adjacent Stream:	Name =	Unnamed Tributary
	Impaired =	No
	Within Vicinity =	No
Equivalent Customers Served:	Residential =	70
	Industrial	0
	Commercial =	0
Health Hazard:	Groundwater Contaminated	
Construction Feasibility:	WWTP/Collection System Available	No
	WWTP/Collection System Upgrades Required	
	WWTP/Collection System Not Available	
Growth Potential:	Three other small clusters of homes nearby, including the Draper Valley Presbyterian Church. These communities could be served by a slightly larger treatment system.	
Total Project Cost:	\$770,000	
Present Worth Per Connection:	\$13,625	

XII. FUNDING

General

This report documents the urgent need for the Commonwealth of Virginia and the General Assembly to continue funding the Southern Rivers Program to address water quality in all of the Southern Rivers region as well as within the New River Valley Planning District. The construction of wastewater collection and treatment facilities is an extremely expensive endeavor, requiring significant financial assistance from a variety of funding sources. Southern Rivers financing can be utilized to leverage financial assistance in the form of loans and grants from both State and Federal Government. It is difficult to fund project solely by relying on a single source, as the funding levels are finite, being drawn from pools of money allocated each fiscal year. Therefore, a discussion of some non-traditional, as well as the traditional funding sources have been included.

The following describes the traditional sources of funding normally used to assist in financing wastewater projects:

Virginia Department of Housing and Community Development (DHCD)

Using funds from the United States Department of Housing and Urban Development, DHCD in turn funds a variety of project types to benefit Low to Moderate Income (LMI) households, eliminate slum and blight, and provide for urgent community development needs. DHCD will fund on-site community and individual sewage treatment systems as well as off-site community systems that have a direct household benefit. The Community Development Block Grant (CDBG) Program has approximately \$23,000,000 available annually in Virginia. The following grants are available:

1. Planning Grants – Available anytime between January and September 30, DHCD has \$500,000 reserved annually for this purpose. Each local project is eligible for a \$25,000 planning grant, while regional projects can receive up to a \$40,000 planning grant.
2. Indoor Plumbing Rehabilitation (IPR) - \$8,000,000 available annually in Virginia to LMI households that lack complete indoor plumbing.
3. Community Improvement Grants (CIG) – there are four types of Community Improvement Grants as follows pertaining directly to wastewater:
 - a. Construction Ready Water and Sewer - \$1,000,000 is reserved for projects that have been designed and are ready for construction. To be eligible, the project must serve at least 65% LMI households.
 - b. Community Development Innovation – Typically this grant is for “self-help” projects, where the community helps construct the system. There is \$350,000 available per project.
 - c. Urgent Need Open Submission – there is \$2,000,000 reserved annually for projects addressing immediate threats to health and safety. A current declaration of emergency by the Governor of Virginia or a current declaration of an immediate and severe health threat by the State Commissioner of Health is required.
 - d. Competitive Grants – assistance is targeted to projects involving water and wastewater improvements, particularly those involving new services to LMI persons. This project type is eligible for up to \$1,000,000.

Appalachian Regional Commission (ARC)

The ARC’s purpose is to create opportunities for self-sustaining economic development and improved quality of life in designated Appalachian localities. The focus is on projects that will retain or create jobs, however, counties designated as “Distressed” can apply for funds for projects that are not job related. It should be noted that grantees must contribute matching resources and the maximum grant is \$500,000. ARC funding is administered by DHCD.

Virginia Clean Water Revolving Loan Fund

Since being established, the VCVRLF has contributed over \$1 billion in low interest financing for 250 wastewater projects in Virginia and has recently started the Onsite Pilot Wastewater Treatment and Disposal Program. This program addresses malfunctioning or inadequate on-site wastewater disposal systems where public health or water quality concerns exist and where connection to a public sewer is not feasible. Loans are available to local governments with a 20-year (30-year on lines) maximum loan period. The program is administered by the Virginia Department of Environmental Quality, the Virginia Resource Authority and with the cooperation of the Virginia Department of Health.

USDA Rural Development (RD)

Rural Development typically has between \$9 million and \$14 million available as grant funding annually. RD funding can be used for all types of wastewater projects including new construction, expansion, improvements, line installation, treatment facilities, and related costs (engineering fees, surveying costs, legal fees, etc...). To qualify for grant funding, RD will compare the project service area’s median household income (MHI) with the statewide median household income (SMHI). A project qualifies for 75% grant funding if the applicant’s MHI is below 80% of the SMHI. A project qualifies for a 45% grant if the applicant’s MHI does not exceed 100% SMHI. Rural Development also requires a minimum monthly sewer bill of \$33 for a project to be grant eligible.

Rural Development has three interest rates available for loan funds...poverty, intermediate and market. Loan terms are available for up to 40 years.

Southeast Rural Community Assistance Project, Inc. (SERCAP)

The SERCAP Program provides loan funding for sewer projects in all rural, low-income communities from Florida to Delaware. There are no application deadlines and the maximum loan is \$150,000 for 1 to 10 years at interest rates from 3% to 7%. This funding is available for any type of sewer project, but is typically used for small projects, gap financing or contingency/overrun financing.

Virginia Resources Authority (VRA)

For wastewater projects, VRA issues bonds in the national market and lends the proceeds to localities. The bonds can be General Obligation or Revenue backed dependent on whether the borrower has

taxing authority. By using the moral obligation of the State, VRA can offer reasonable interest rates to the small borrower.

VRA may issue up to \$300 million in revenue bonds to localities for improvements to water and/or wastewater facilities. The bonds may be either long or short-term fixed or variable rate debt with each financing structured on current market conditions and investor preference. In general, due to State backing, the VRA can obtain more attractive rates than most local governments. Localities must demonstrate the ability to repay the bonds.

VML/VACo

Sponsored by the Virginia Municipal League and the Virginia Association of Counties, the VML/VACo Finance Program includes the Pooled Bond Program. This program allows localities to take advantage of sharing fixed costs across a group of borrowers and benefits from favorable cost structures due to the size and volume of the program. The Pooled Bond Program funds are available for all types of wastewater projects. The bonds are sold twice per year, in the Spring and Fall.

Non-Traditional Funding Options

As discussed in the preceding paragraphs, there are numerous funding sources available that provide low interest loans for sewer projects and few sources available for grants. There are no grant monies available for addressing the most pervasive wastewater problem in our region...inflow/infiltration (I/I) problems. I/I problems take up valuable wastewater plant capacity that could otherwise be used to serve additional customers. Due to the high cost of the proposed projects presented in this study, funding provided by traditional sources will not be adequate to reduce user costs to an affordable level.

Virginia FY2006 Water Quality Improvement Fund (WQIF)

Administered through the Virginia Department of Conservation and Recreation, the Water Quality Improvement Fund will provide approximately \$4.7 million in funding to support strategic nonpoint source water quality initiatives and cooperative nonpoint source pollution programs. Proposals from local governments can range from \$50,000 to \$200,000, and pending the availability of future WQIF funding, multi-year requests may total up to \$800,000.

Virginia Tobacco Indemnification and Community Revitalization Commission

The Virginia Tobacco Commission was created in 1999 by the General Assembly of the Commonwealth as a way to re-invest monies from the national tobacco settlement back into tobacco farming areas of Virginia. Although the Commission has seven funding programs, two of those programs are applicable to wastewater infrastructure...the Economic Development Fund and the Special Projects Fund.

The Economic Development Fund may be used for "...utility infrastructure creation or improvements for economic development sites, including acquisition and/or development of land..." and is meant to promote economic growth and development in tobacco-dependent communities in an equitable manner throughout the Southside and Southwest regions of the Commonwealth in order to assist such

communities in reducing their dependency on tobacco and tobacco-related business with the following restrictions:

1. The Commission will not entertain any request for which 100% of the cost is expected to be borne by Commission funds.
2. Additions or improvements to any public utility designed solely for residential use are not eligible.

The Special Projects Fund is available for utility infrastructure projects only if the project involves the active participation of three or more tobacco region localities. (Note: Floyd County is the only PDC member situated in the tobacco region.)

National Oceanographic and Atmospheric Administration (NOAA)

Since 1997, the NOAA has provided \$66 million for PRIDE in southeastern Kentucky.

This grant funding is provided to address wastewater projects (straight pipes and failing septic systems), environmental education, illegal trash dumps. The creation and funding of a program of this nature for the New River Valley should be pursued.

Private Bond Sales

The Private Bond Market is a legitimate alternative for funding sewer projects studied in this report because: interest rates on bonds are very low and discount rates have fallen, many Virginia investment banking firms offer access to non-rated localities for selling bonds, and combining resources to create regional authorities with large customer bases makes the sale of revenue bonds on the private market a more viable alternative. It is important to note that the process for selling bonds on the private market is streamlined compared to many of the traditional funding options, and has fewer restrictions on where the proceeds are spent.

Private Activity Bonds

Private activity bonds are securities issued by, or on behalf of a local government to provide debt financing for projects used for the trade or business of a private user. Private activity bonds can be used for water, sewage or solid waste facilities as well as industrial and manufacturing facilities and equipment. Generally speaking, investors purchase the bonds, and then the money is lent to users for the completion of the project. The investor's return comes through the operational proceeds of the project. Private activity bonds do not constitute an obligation of the State or any of its jurisdictions. Because they are exempt from both federal and state taxes, private activity bonds bear interest at a significantly lower rate than do corporate bonds or traditional bank notes, and can generate significant interest savings over the term of the loan.

In Virginia, the Virginia Resources Authority (VRA) can issue private activity bonds for wastewater treatment projects used by private interests.

Design/Build/Finance

There are several private utility companies specializing in the financing, construction, operations and maintenance of de-centralized managed wastewater systems. NCS Wastewater Solutions of Puyallup, WA provides customers in non-sewered areas with affordable wastewater treatment systems. NCS Wastewater Solutions provides design/build and system management services throughout the west coast. Another successful example is Tennessee Wastewater Systems, Inc. Established in 1993; TWS owns, operates, maintains and manages on-site wastewater collection and treatment systems for numerous developments in Tennessee, making them the 4th largest wastewater utility in the state! TWS is a public utility, regulated by the State of Tennessee and could serve as a viable model for ownership and management of decentralized wastewater systems throughout the New River Valley.

Privatization

The conversion of government-owned wastewater facilities to private ownership or management is one of the fastest growing areas of privatization at the local government level. The majority of sewer system privatizations are in the form of long-term contracts for the operation and maintenance (O&M) of facilities. Long-term contracts also commonly handle facility upgrades and expansions, as well as customer service. It is important to note that short-term O&M contracts typically do not offer large enough savings to cover capital investment needs. Long-term contracts (10 to 20 years) allow both parties to share and spread risks, implement a broader range of cost savings initiatives and offer greater annual cost savings. With the 1997 changes in IRS rules, long-term contracts do not jeopardize the tax-exempt status of existing bonds and also do not preclude the use of State Revolving Loan Funds.

The objective of a long-term O&M contract is to form a cooperative partnership between the local government and the private management company that will meet current and future wastewater needs, alleviate existing and potential environmental problems, meet State and Federal environmental compliance requirements, reduce costs, reduce potential rate increases, and improve system reliability/performance. Thus far, privatization of wastewater facilities has been very successful for small systems (less than 1500 population) and has a proven track record of reduced injuries, better compliance and reduced costs.

Special Legislation

As noted at the beginning of this section, the General Assembly needs to adequately fund the Southern Rivers Program as it does the Chesapeake Bay Program to provide initial capital to encourage other funding sources to invest in the improvement of water quality in the Southern Rivers region of the state.

Sewer Service and Tax Increment Financing Districts

These districts can be established pursuant to Virginia Code Section 15.2-2400 and are common in several areas of Virginia. Property owners within the district pay an additional tax per \$100 of assessed valuation annually to amortize the debt incurred for the installation of sewer facilities. The provision of sewer facilities protects the health and safety of the residents and conserves property values within the district.

Canaan Valley Institute (CVI)

The Canaan Valley Institute is a regional non-profit organization that supports watershed groups throughout the Mid Atlantic Highlands Region. They provide technical and limited funding resources for planning and design of water quality projects including alternative wastewater projects, usually decentralized managed treatment options. CVI can provide funding through small grants and resource requests applied through the CVI outreach staff as well as technical assistance including preliminary engineering reports, design, facilitation, outreach education coordination, grant writing assistance and funding research.

Funding Examples

1. New York State, 1996 Clean Water/Clean Air Bond and the Clean Water Revolving Loan Fund. Administered by the New York State Environmental Facilities Corporation (EFC) and the State Department of Environmental Conservation (DEC), and offers short-term interest-free loans and long-term low interest rate financing. Short-term loans enable municipalities to undertake project design and construction without incurring the interest expenses normally associated with commercial loans. CWSRF short-term loans are typically used as bridge financing until the borrower obtains long-term financing.
2. "Co-Funding" initiatives...a model of intergovernmental cooperation that maximizes public resources and keeps wastewater treatment affordable for rural communities.
3. Loudon County...sewer service districts...additional tax on top of the annual real estate tax.
4. New Jersey...The New Jersey Environmental Infrastructure Financing Program. This is financed by a Trust bond sale. The financing program is a partnership between the Department of Environmental Protection and the NJ Environmental Infrastructure Trust. It combines the interest-free loans from DEP's State Revolving Funds with market rate loans from the sale of the Trust bonds. The participants in the Financing program are able to borrow money at half the rate the Trust pays on its AAA-rated bonds.
5. Pennsylvania...The Pennsylvania Infrastructure Investment Authority, or PennVEST, offers multi-year, low interest loans for sewer projects. Grants are also available through PennVEST.
6. Kirkland, Washington Emergency Sewer Program.
7. Portland, Oregon's mandatory sewer connection program. This program requires developed properties to connect to the sewer system within three years after the sewer service becomes available. The program also provides low interest loans to finance connection costs and gives some property owners the option of delaying connection in case of financial hardship. The program includes a Senior Citizen deferral and a safety net program for eligible low-income homeowners.
8. Chester Borough, NJ, with a population of just 1,500, entered into a private long-term (20-year) operation and maintenance contract for its wastewater collection and treatment systems in 1997. The Borough has saved approximately 30% per year on operation and maintenance and they receive a fee from the private contractor each year to pay for an independent engineer to monitor their performance and to assure that the facilities are being properly maintained.

XIII. IMPLEMENTATION

Education, Enforcement and Enticement

In order to be financially stable, revenue from utility systems must be sufficient to retire debt, create debt reserve, and cover the cost of operation and maintenance. Since revenue is generated from the users of the system in question, the utility provider must have assurance of the participation of a sufficient number of users to create positive cash flow. Most funding agencies, in fact, require signed user agreements or user contracts prior to the issuance of project funding. When the utility being considered is wastewater, the willingness of the public to participate in the project is much less than that experienced when a water system is being constructed. The reasons for this unwillingness to participate may be summarized into three general categories.

Education

First the potential participant may not understand the associated problems of inadequately treated wastewater. Potential health problems are sometimes overlooked if wastewater is not actually “ponding” in populated areas. Also health and environmental impacts of stream degradation may not be related to individuals and many times the old saying “out of sight- out of mind” is prevalent. It is critical therefore, that local governments and regulatory agencies who share the responsibility of protecting health and the environment properly educate the potential participant as to these dangers.

Enticement

Secondly, participation is decreased due to its cost. Funding must be made available which will make sewer service to even low to moderate income residents affordable. Programs such as community development block grants, which pay for connection fees need to be expanded. Please refer to the “funding” section of this report for additional information.

Enforcement

When education and enticement are not sufficient to increase participation by potential users, it may be necessary to enforce existing laws concerning the discharge of raw or improperly treated wastewater. Public Health laws to a large extent have not been enforced due to the lack of alternative methods of wastewater handling and treatment. As alternatives are developed and implemented, these laws and regulations will need to be enforced as an incentive to connection to the approved system. There are existing laws regarding the discharge of raw sewage, or improperly treated wastewater. The Virginia Department of Health is responsible for enforcing these situations once the local health department is made aware of such violations. This is currently a criminal violation (Class I Misdemeanor). Typically the party may be found guilty in court and fined up to \$2,500, but this is usually reduced and there is no mandated cleanup responsibility on the part of the violator, only guilt of the criminal misdemeanor that may be charged again and brought before the court again if the violation continues. This process is resource intensive on the local health department such that other programs may be adversely impacted. This situation should be changed from a criminal violation to a civil penalty so that it is more efficiently

and effectively enforced. It is also recommended that the fine be a larger dollar amount than the hook up fee.

Regional Authority

The implementation of the recommended projects in this study, particularly the de-centralized sewer projects, would be helped greatly by the creation of a regional authority. This regional authority could be established and could cross any political boundary such as counties, towns, cities and service authorities. In this option, the local sewer providers could concentrate on the traditional centralized sewer systems that they have knowledge and experience owning and operating, while the regional authority would provide management, tracking and maintenance of de-centralized systems. The regional authority would have board representation from all of the localities it serves, but would own and operate the de-centralized sewer systems throughout the New River Valley.

The advantages of a regional authority are quite evident. The current centralized sewer system owners would not have to re-educate/re-train their staffs on de-centralized sewer construction, maintenance and record keeping. Sewer rates for de-centralized customers would be uniform across the service area, and an economy of scale could be realized by having only one operation and maintenance staff to serve the entire area rather than duplicating staff and services throughout the region. It would also be easier for a regional authority to obtain financing than for individual system owners.

Currently, the New River Valley Planning District (NRVPD) is comprised of several regional type authorities that support several community services, such as, wastewater collection / treatment, water treatment and solid waste disposal. The implementation of the aforementioned regional authority by incorporating it into the structure of an existing authority makes even more sense from the standpoint of cost and operational efficiencies. Given the fact that the Pepper’s Ferry Regional Wastewater Treatment Authority provides wastewater collection / treatment service to a part of the NRVPD the greatest economy of scale may involve the expansion / modification of their member services to provide management, tracking and maintenance of de-centralized systems. The aforementioned is one of many possibilities available within the region in regards to utilizing existing organizations to improve water quality by means of decentralized sewer systems.

The disadvantages of a regional authority for de-centralized sewer systems is that the rates would be set by the authority with no control by the local governments.

XIV. CONCLUSIONS AND RECOMMENDATIONS

Conclusions

The Design Team investigated 116 centralized sewer projects and 18 decentralized projects throughout the New River Valley Planning District. Each project was scored and ranked within the evaluation matrix for each project type. Upon presentation of the final project rankings, the Advisory Management Team endorsed the further study of the top 20 centralized projects and the top 6 decentralized projects. It is important to note that all 134 of the initially considered projects are valid projects, however, the scope of this study did not allow for in-depth analysis of all of the projects.

After further study of the selected projects, it was determined that...

- The 20 centralized projects will serve approximately 3,135 connections at a cost of \$67,404,744.
- The 6 decentralized projects will serve an estimated 424 connections at a cost of \$5,562,970.

Recommendations

Based on the information gathered during the course of this study, the following recommendations are made:

- It is imperative that the Southern Rivers Program be provided additional grant funding to help solve this critical environmental and public health threat, such that the Southern Rivers Region of Virginia can benefit from a cleaner, healthier and more economically viable future.
- Conduct a special informational session with legislators to emphasize the need and garner support.
- Begin the process of implementing the 3 E's...Education, Enforcement and Enticement.
- The Planning District Commission should continue with its efforts to help local governments put together educational campaigns and documentation to implement the recommended sewer system projects.
- Change the laws regarding the discharge of raw sewage or improperly treated wastewater (residential only) such that the violation of the law is a civil offense rather than a criminal offense. This will allow the Virginia Department of Health to enforce the law more efficiently and effectively.
- Set the fines for discharging raw sewage, or improperly treated wastewater at a higher dollar amount than the cost of the connection or "hook up" fee.
- Encourage the enacting of "mandatory hookup" ordinances within the study area and make sure that the ordinances are enforced.

- Encourage local sewer providers to allow low income users to pay for connection fees over a one year period with no interest.
- Foster support for the recommendations set forth in this Study by holding a public presentation including local, state and federal officials.

Appendix A – Letters of Support

AT A REGULAR MEETING OF THE BOARD OF SUPERVISORS OF FLOYD COUNTY, VIRGINIA, HELD ON TUESDAY, AUGUST 14, 2007 AT 8:30 A.M. IN THE BOARD ROOM OF THE COUNTY ADMINISTRATION BUILDING, THEREOF:

PRESENT: David W. Ingram, Chairman; Jerry W. Boothe, Vice Chairman; Diane B. Belcher, J. Fred Gerald, Kerry W. Whitlock, Board Members; Daniel J. Campbell, County Administrator; Terri W. Morris, Assistant County Administrator.

The following action was taken:

On a motion of Supervisor Belcher, seconded by Supervisor Gerald, and unanimously carried, it was resolved to adopt the following resolution.

RESOLUTION SUPPORTING THE PLANNING DISTRICT COMMISSION'S APPLICATION FOR THE VIRGINIA DEPARTMENT OF HOUSING AND COMMUNITY DEVELOPMENT'S SOUTHERN RIVERS WATERSHED ENHANCEMENT PROGRAM (SRWEP) PLANNING GRANT TO CONDUCT A NEEDS ASSESSMENT, PRIORITIZATION, AND PRELIMINARY ENGINEERING REPORT OF INADEQUATE WASTEWATER TREATMENT FACILITIES IN FLOYD, GILES, MONTGOMERY AND PULASKI COUNTIES

WHEREAS, the Virginia Department of Housing and Community Development's Southern Rivers Watershed Enhancement Program (SRWEP) is designed to improve water quality in the streams and groundwater of the "southern rivers" region of Virginia while directly enhancing the quality of life of communities and their residents through installation and expansion of sewage treatment and collection systems; and

WHEREAS, the planning, engineering, and construction grants program is available to cities and counties proposing projects in those areas of Virginia that **do not** drain into the Chesapeake Bay; and

WHEREAS, the Planning District Commission, in consultation with the four jurisdictions, has identified a number of key study areas, including but not limited to Dodd Creek; and

WHEREAS, the New River Valley Planning District Commission is submitting a \$150,000 SRWEP grant on behalf of Floyd, Giles, Montgomery and Pulaski Counties to perform a Needs Assessment/Prioritization and Preliminary Engineering Report. The funds and effort will be equally divided amongst the four-county region to identify sub-standard wastewater treatment facilities, whether antiquated individual systems, locations for decentralized systems, and/or extensions to existing public wastewater systems.

NOW, THEREFORE, BE IT RESOLVED, that the Board of Supervisors of Floyd County, Virginia, hereby supports the New River Valley Planning District Commission's submission of an application for planning and engineering funds from the Virginia Department of Housing and Community Development's Southern Rivers Watershed Enhancement Program.

Mr. David W. Rundgren, Executive Director
New River Valley Planning District Commission
6580 Valley Center Drive, Box 21
Radford, VA 24141

RE: New River Valley Southern Rivers Wastewater Evaluation Program

Dear Mr. Rundgren:

Please accept this letter as evidence of Giles County's support for your application to the Southern River's Program.

It has been suggested that many of Giles County's residents are served by aging and/or failing septic systems. Due to the difficulties of surveying and testing every septic system in the county, we feel this program will help identify and address our wastewater concerns. With the PDC's goal of exploring the areas located within the vicinity of streams identified by DEQ as being impaired, we believe this is an excellent area in which to focus our efforts and any available resources.

Thank you for your work on issues dealing with the health and welfare of the citizens of the New River Valley. Please feel free to contact us if you need further assistance.

Sincerely,

Chris McKlarney
County Administrator

Cc: Kevin Byrd, PDC

AT AN ADJOURNED MEETING OF THE BOARD OF SUPERVISORS OF THE COUNTY OF MONTGOMERY, VIRGINIA HELD ON THE 23rd DAY OF JULY, 2007 AT 6:00 P.M. IN THE BOARD CHAMBERS, MONTGOMERY COUNTY GOVERNMENT CENTER, 755 ROANOKE STREET, CHRISTIANSBURG, VIRGINIA:

R-FY-08-09
A RESOLUTION SUPPORTING THE
PLANNING DISTRICT COMMISSION'S APPLICATION
FOR THE VIRGINIA DEPARTMENT OF HOUSING
AND COMMUNITY DEVELOPMENT'S
SOUTHERN RIVERS WATERSHED ENHANCEMENT PROGRAM (SRWEP)
PLANNING GRANT TO CONDUCT
A NEEDS ASSESSMENT, PRIORITIZATION, AND
PRELIMINARY ENGINEERING REPORT
OF INADEQUATE WASTEWATER TREATMENT FACILITIES IN
FLOYD, GILES, MONTGOMERY, AND PULASKI COUNTIES

On a motion by Mary W. Biggs, seconded by James D. Politis and carried unanimously,

WHEREAS, The Virginia Department of Housing and Community Development's Southern Rivers Watershed Enhancement Program (SRWEP) is designed to "improve water quality in the streams and groundwaters of the "southern rivers" regions of Virginia while directly enhancing the quality of life of communities and their residents through installation and expansion of sewage treatment and collection systems; and

WHEREAS, Montgomery County has supported the development and improvement of wastewater facilities in the seven villages in Montgomery County and has strongly supported clean water initiatives through the comprehensive planning and village planning processes; and

WHEREAS, The planning, engineering, and construction grants program is available to cities and counties proposing projects in those areas of Virginia that **do not** drain into the Chesapeake Bay; and

WHEREAS, The Planning District Commission, in consultation with the four jurisdictions, has identified a number of key study areas, Lafayette and the confluence of the North and South Forks of the Roanoke River as an area of interest; and

WHEREAS, The New River Valley Planning District Commission is submitting a \$150,000 dollar SRWEP grant on behalf of Montgomery Giles, Pulaski, and Floyd Counties to perform a Needs Assessment/Prioritization and Preliminary Engineering Report. The funds and effort will be equally divided amongst the four county region to identify sub-standard wastewater treatment facilities, whether antiquated individual systems, rural clusters for decentralized systems, and/or extensions to existing public wastewater systems.

NOW, THEREFORE, BE IT RESOLVED, The Board of Supervisors of Montgomery County, Virginia hereby supports the New River Valley Planning District Commission's submission of application for planning and engineering funds from the Virginia Department of Housing and Community Development's Southern Rivers Watershed Enhancement Program.

The vote on the foregoing resolution was as follows:

FOR THE VIRGINIA DEPARTMENT OF HOUSING
AND COMMUNITY DEVELOPMENT'S
SOUTHERN RIVERS WATERSHED ENHANCEMENT PROGRAM (SRWEP)
PLANNING GRANT TO CONDUCT
A NEEDS ASSESSMENT, PRIORITIZATION, AND
PRELIMINARY ENGINEERING REPORT
OF INADEQUATE WASTEWATER TREATMENT FACILITIES IN
FLOYD, GILES, MONTGOMERY, AND PULASKI COUNTIES

WHEREAS, The Virginia Department of Housing and Community Development's Southern Rivers Watershed Enhancement Program (SRWEP) is designed to "improve water quality in the streams and groundwaters of the "southern rivers" regions of Virginia while directly enhancing the quality of life of communities and their residents through installation and expansion of sewage treatment and collection systems; and

WHEREAS, Montgomery County has supported the development and improvement of wastewater facilities in the seven villages in Montgomery County and has strongly supported clean water initiatives through the comprehensive planning and village planning processes; and

WHEREAS, The planning, engineering, and construction grants program is available to cities and counties proposing projects in those areas of Virginia that **do not** drain into the Chesapeake Bay; and

WHEREAS, The Planning District Commission, in consultation with the four jurisdictions, has identified a number of key study areas, Lafayette and the confluence of the North and South Forks of the Roanoke River as an area of interest; and

WHEREAS, The New River Valley Planning District Commission is submitting a \$150,000 dollar SRWEP grant on behalf of Montgomery, Giles, Pulaski, and Floyd Counties to perform a Needs Assessment/Prioritization and Preliminary Engineering Report. The funds and effort will be equally divided amongst the four county region to identify sub-standard wastewater treatment facilities, whether antiquated individual systems, rural clusters for decentralized systems, and/or extensions to existing public wastewater systems.

NOW, THEREFORE, BE IT RESOLVED, The Planning Commission of Montgomery County, Virginia hereby supports the New River Valley Planning District Commission's submission of application for planning and engineering funds from the Virginia Department of Housing and Community Development's Southern Rivers Watershed Enhancement Program.

William Stephen Howard, Chair

**Resolution Supporting the
NRV Southern Rivers Wastewater Evaluation Project**

WHEREAS, the County of Pulaski is a member of the New River Valley Planning District Commission (NRVPDC), and;

WHEREAS, the NRPDC has been partnering with the County of Pulaski on numerous projects in the past that improve the quality of life for the County's residents, and:

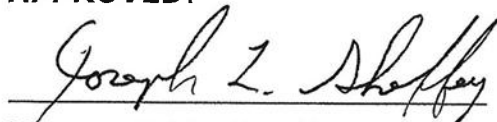

WHEREAS, through an extended partnership with the NRVPDC, the County of Pulaski wishes to participate in a regional application for \$150,000 from the Southern Rivers Watershed Enhancement Program (SRWEP) fund for the "New River Valley Southern Rivers Watershed Evaluation Project", and;

WHEREAS, the funding from the SRWEP program will be used to evaluate existing septic systems within that may have an adverse impact on the surrounding streams and rivers within the County, and;

NOW THEREFORE, BE IT RESOLVED THAT, it is the will of the Board of Supervisors of the County of Pulaski to support the NRVPDC's funding application and authorize the County Administrator to sign and submit all appropriate documentation necessary for the application for funding.

Adopted this 23rd day of July, 2007.

RE: New River Valley Southern Rivers Wastewater Evaluation program

Dear Mr. Rundgren,

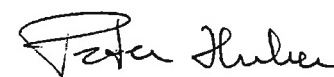

Please accept this letter as evidence of Pulaski County's support for your application to the Southern River's Program.

It has been suggested that many of Pulaski County's residents are served by aged and/or failing septic systems. Due the difficulties of surveying and testing each and every septic system located in Pulaski County, we feel this program will help identify and address our wastewater concerns. With the PDC's goal of exploring the areas located within the vicinity of streams identified by DEQ as being impaired, we believe this is an excellent area in which to focus our efforts and any available resources.

I would like to commend the Planning District Commission and it's staff for working on issues so dear to the public health and welfare for all those who reside within the New River Valley region. Your hard work is most certainly appreciated. Please know that you will have the support and assistance of the County's staff as you move forward with your programs.

Should you need further assistance, please feel free to contact me at any time.

Kind regards,

Peter M. Huber, County Administrator

New River Valley Planning District
6580 Valley Center Drive, Suite 124
Box 21
Radford, Virginia 24141

Dear Mr. Rundgren:

We are writing this letter to show our support for the New River Valley Planning District's Southern Rivers Regional Sewer Study. It is our understanding that this study is intended to serve as a road map for future implementation of sanitary sewer collection, treatment and disposal projects within the New River Valley with a focus on improving water quality. We believe that this type of study is vital to the interests of the residents and businesses of the New River Valley as a whole. The mission of the New River Watershed Roundtable is to promote better water quality through fair, open dialogue and effective partnerships. We envision the New River Watershed Roundtable as a community at work to protect and enhance the water quality of the New River Watershed.

In conclusion, we fully support the efforts of the Planning District as they conduct this regional sanitary sewer study and feel that this study is vital to our efforts to promote better water quality within the New River Valley. To this end, should there be anything we can do to assist your effort, please contact us at your convenience. Thank you.

Sincerely,

Ron Powers
President
